3570. HELP - Upper freq. on 6146B

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-30 00:00:00 UTC
From: ve6inm@telusplanet.net
Message-ID: <7dqq3ljfv1@nnrp1.dejanews.com>
Source record: 71819

Has anyone ever tried to "push" a 6146 up into the 2mx. range. I have an abundance of 6146B's and W's and was thinking about building up a linear for 2mx. Easier to develop the B+, etc. than on a 4CX250 series. I know the specs say good to about 60mHz, but was curious if anyone ever tried to squeeze it into service above that range. Any and all opinions/help are appreciated.

No. At least, not the ones I've wired incorrectly and spent much time
trying to figure out why there was either no RF output, or RF
output at a constant frequency. :-)

Hello--
The 1957 ARRL Handbook offered a schematic for a two-band, 125-watt
grounded-cathode amp using PP 6146s and plug-in coils; a screen-grid
circuit performs neutralization.

Ref.: pp.425-427

Not exactly.

What the counterpoise does is to lower the resistance of the return path.

You should have at least a ground rod, as a minimum, but even a piece of wire at the end of the coax will work to some extent. Adding a counterpoise will lower the resistance of the return path and increase the efficiency of the antenna system.

Source record: 71682

Please, Yaesu certainly did NOT invent the diode ring type product detector!!! That circuit is older than either of us. It goes 'way back before Yaesu. I will find my copy of QST, but what on earth os a "mesh diode" ? That is not a familiar electronic term on this side of the Atlantic Ocean. My guess would be that it might equate to "PIN Diode", because I have read articles that claimed improvement in receiver dynamic range based on replacing poorly chosen RF switching diodes with PINs.
Fraternally,

RICHCOM,

I am not generally a grump, but your method of posting to the newsgroups regarding items you are selling on EBAY is getting tiresome. If someone wnats to peruse EBAY and see what's for sale, fine, but parallel postings to the newsgroups is not appropriate, especially since you have no description in your posts, just a link to EBAY! Based on the number of items you've been selling and parallel posting here, you must be in the business of selling used equipment. In such case, you are violating newsgroup rules twice, once for your own gain, and the second by promoting EBAY.

Chris,

That's an excellent idea. Because the UPS could be used as an inverter
for your station, powering items that will not run on 12V, you could add
a *FEW* batteries in parallel, and have a station that will stay powered
during the longest power outage. Calculate your average ah usage during
an average day, and current limit a trickle charge circuit delivering 5%
overcharge, and you'll always have topped off batteries in the event of
an extended need.

You tell me to mind my own business; actually, I do, but not in an inappropriate manner on the newsgroups.

Since you apparently think what you're doing is fine, I'll address the newsgroups instead:

Am I wrong? Is there anyone out there who will defend RICHCOM's shotgun posts to the newsgroups? Maybe I've lost touch with reality, and EVERYBODY who sells anything on EBAY should post a message with only a link to EBAY.

No, YOU MIND YOUR BUSINESS -- elsewhere!

If I wanted to look at equipment that is being auctioned on Ebay, I'd look on Ebay. But I'm not, so all these Ebay posts are just a waste of Usenet for me.

Plain "forsale" posts, even if inappropriate for the newsgroup in question, at least have some information about what is being sold and the asking price. Articles with nothing but a pointer to Ebay contain absolutely *nothing* of value or even interest.

Dave

The rec.radio.amateur.boatanchors FAQ site has the following:
From Beveridge to Oscar
indexes to back issues of QST, 73, Ham Radio, and CQ magazines
also an index of equipment reviews - hard copy or floppy disk
versions
DiDah Publishing
PO Box 7368
Nashua, NH 03060
603-878-3628

Info on magazines, manuals, parts, web sites, etc - all kinds of
neat groovy stuff about boatanchors can be found on the FAQ site:
http://www.cs.unc.edu/~nick/rrab.faq.htm

Additions & Corrections welcomed

I find the letters in the subject line "FA" to be a nice thing for
people advertising ebay articles. If I see FA, I just unmark the post,
and that's that--no wasted time, as I don't care to use ebay (I've used
it before, but the thrill of auctioning doesn't do it for me--I'd rather
deal with the seller directly).

I've noticed that the people selling things on ebay and then posting
stuff in this newsgroup have either used FA in the subject line, or
plainly said something to the effect, for auction on ebay. So, I have
no qualms about people using this newsgroup to post stuff on ebay.

Photograph of equipment is best when taken in the garden when it is
overcast.
have scanned several circuits directly, just scanned AN/PRC-10 chassis
and photo quality is good as can be expected with lowest possible
quality grey-scale, pcb's are usually good provided it is maximum
distance from screen of 1cm. I use a cheap Primax 4800 scanner
Some of the direct scanned pictures have been used in local
publications

>Where did you get the resonators? Sounds like an interesting design.

it is several sources, I got mine from a LA3VW. Price at ELFA in
Sweden was about $1.- ea. in small quantities (1994 catalogue).
Just tested ladder filters for 960 and 250kHz. The application of
250kHz elements serves two purposes in my LW frequency standard
receiver, two elements are used in RF ladder filter with 4dB loss on
243kHz, but has at least 60dB rejection on 250kHz and higher
frequencies, and another two as bandpassfilter on 250kHz IF, with high
attenuation on 243kHz. The two elements are connected instead of coils
in an ordinary BPF circuit.
In the ladder filter some frequency adjustment may be done by adding
inductance in series with the resonnators. The 245kHz filter may be
moved to 243kHz by adding 100uH coils, and it will move 12kHz for
450uH value coils.

The elements are Murata CSB20D and an unknown marked 960J.
some info may be found on http://www.murata.com but it did not help me
much

would suggest NE614 as AM synchronous demodulator and SSB/CW product
detector, it may also serve as (balanced) modulator for AM/SSB
transmitter, not sure how much balance it has, but it doesn't matter
if it is for AM only. The limiting IF amplifier may function as
carrier oscillator. I have made similiar circuits with SN76660N and
MC1351P, it was possible to achieve 40dB balance as modulator/mixer.
The first IF amplifier (pin 1-14-15-16) if fine for RX IF amp.
An article in Radcom shows MC1351P as multimode detector; for
CW/AM/SSB/FM

For-sale ads for commercial ham gear, via ebay or otherwise, are not
appropriate on rec.radio.amateur.homebrew. Based on your earlier
responses to other people ("MIND YOUR OWN BUSINESS"), this and all other
ads for unrelated equipment you post to the group will be forwarded to
your ISP's postmaster and abuse accounts.

3603. bastard type ladder IF filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-31 00:00:00 UTC
From: la8ak@online.no
Message-ID: <37029323.247326845@news.online.no>
Source record: 71702

A bastard filter was made for input selection on 243kHz LW receiver
it is important to have highest possible attenuation at 250kHz (IF)
and 257kHz (mirror frequency). A super selective (60Hz BW) 5 pole
BP-filter is used, 2x Murata CSB250D (paralell resonnance),
attenuation increases 60-70dB on 240 and 260kHz.

243kHz ladder filter:

75 ohm ---100uH--CSB250D--|--68uH--CSB250D--|--75 ohm
i/p | | o/p
.022 .022 F
|----------|---gnd

series resonnance of this type 243.4-244kHz, the used elements
selected and has 243.4 and 243.7kHz, series inductance is used to move
this down to 243kHz.
The correct inductance is believed to be 82 H, but it seems to work
using 100 and 68 H instead.

Filter loss = 6dB
0 243.0kHz
-3 242.24 243.3
-6 242.50 243.4
-10 242.16 243.57
-20 241.1 244.10
-30 238.9 244.9
-40 231.5 245.9
-50 147.9 247.1
-60 - 248.2
-70 - 249.2
-80 - 249.9
-90 - 250.41

Perhaps I did not make it sufficiently clear as to my idea.

What I was thinking of was using the NE602 as a crystal controlled (or perhaps VXO) direct conversion receiver. In transmit mode the mixer would be unbalanced and act as a buffer for feeding the RF power amplifier.

This could possibly be as simple as grounding, through a resistor, one of the mixer inputs with the Morse code key.

Have you thought of making one? It will take some digging, but I'm sure the actual values used have been published in a number of places years ago. Components and the means of measuring them have improved since the B&W was popular, and it may not be the task it once seemed to be. Further, I wonder what kind of shape the originals would be in these days? If the components have changed value, I'm sure I've seen the values used but seen nothing about what kind of components were used originally, teh plug-in would not be particularly useful.

Another consideration is whether you are replacing one in an existing piece of equipment, or setting out to build something new. If it's the former, you don't have much choice but to replace it or build a substitute. But if you are building something new, there are plenty of other ways of doing the 90 degree audio phase shift, and some of them are bound to give better results.

I've built a grounded grid amplifier based upon the an ARRL Handbook circuit shown for a pair of 3-500's and later substituted 4-400's with the grids tied together. It worked quite well with an output only a bit less than I was getting from the 3-500's previously used.

I have 3 or 4 mil surplus modulator units from APS-104 search radar (likely from B-52 bomber - 1950s/60s vintage). These were used to fire a large pulse magnetron (in another unit). Contains a 4C35 thyratron, four 3B29 HV rectifiers and a few smaller tubes, oil caps, relays,transformers and other parts all in airtight aluminum canister. Also have copy of service manual. Unused, still in original box, collector's item, $65 (pick up only - exceeds UPS size limit) from southeast Alabama. 36330 zip. NOTE: Please REPLACE the "52" with "snow" to spell "snowhill" in my email or call 334-347-5281.

Source record: 71712

I have USED both 50 and 75 ohm Ns. The male "N" plugs I
used did have different pin diameters, just as Gary
described. And yes, a 50 male into a 75 female is
disaster. The inverse will yield, at best, an intermittant
connection. When in short supply of N-50 plugs (undemanding
application), I have thickened the center pin of a N-75 with
a carefully applied layer of solder to ensure contact.

Source record: 71713

Depending on the UPS, if you intend to operate the unit for more than 5 min @
a time get a 12 volt DC fan and point it at the switching transistors. A UPS is
a
short term power supply and was never intended to run for an extended period
of time on the battery. I have a APC 520 ES on my computer and the thing would

have a short life indeed if run for a long time. Very poor air circulation.

A mesh diode is a type of Shottky diode. The semiconductor surface is passivated (oxide film) and then a mesh of fine connections is etched through the oxide to expose the semiconductor surface. A surface metal is sputtered on and you have a mesh diode. They are made by Hewlett-Packard.

Several authors have suggested PIN diodes for switching in HF gear. But they mainly do not know what they are talking about. They invariably suggest the use of PIN diodes with carrier lifetimes about 10 to 20 times too short to work on HF. In fact, at the lower frequencies, conventional silicon switching diodes work better having less junction capacitance.

>supply going.

There was an article in Electronics Now about 4 years ago for building an isolation transformer for repair work by taking two microwave transformers apart and using the two primary winding assemblies on one core for a 1:1 transformer.

One trick is that there are magnetic shunts in microwave oven transformers to act as built in current limiting, same as a neon sign transformer. Some have shunt blocks in the winding window that can be removed.

Source record: 71716

Hello--

IIRC, the "mesh" in "mesh diode" refers to an early method of construction used in tunnel diodes and early-version Schottky diodes. One side of the diode die attached to a platform on a lead, while the other lead terminated in a tiny wire-mesh dome that pressed against the junction to form the second contact.

A modern Schottky would work just as well; the idea behind the Hint/Kink is to use the lower forward voltage drop offered by the Schottky diode to improve detection sensitivity.

No April-1st connection implied or stated, although a friend once referred to these devices as shot-kitty diodes<g>.

They make Circad, which is great! The demo is free, and the only thing that's crippled in it is the ability to output Gerber files (used for commercial production of boards) and (I think) import other software formats. It -will- allow you to print or plot outputs (schematics, PC board layouts, component placement, drill drawings, etc.) to any printer or plotter device with a Windows driver.

It's good for making hobby-grade PC boards with a laser printer and toner transfer paper. Just make sure you adjust the size of the printout. I made a board without checking the pad spacing on the ICs, and the pis are just a -little- too far apart to easily fit a chip. I got it in the board, but I had to splay the pins apart a bit.

Bill,

I have a Ham Radio index that I put together just by copying the appropriate December multiple year indexes. It covers all 268 issues. The last year was a partial and I had to copy the table of contents for all those issues.

I don't know of a downloadable one. I've worked a little on scanning it and OCRing it but little luck so far. It would be a monumental typing task.

If you would like a copy of the Ham Radio Index I can probably get it copied for $6 plus a $1 for shipping. It is 30 double sided pages......Let me know...Rick...W5RH

>(opening mouth and removing all doubt)
well, not so much this time.
>
..... perhaps the background noise simply is too weak to pass.....
it was the matter with Kenwood TR-7010 2m ssb/cw mobile transceiver,
so they later changed standpoint on this matter and biassed the
diode-ring, with the unfortunate result of heavy distortion. I removed
the 100k bias resistor together with 2x 30pF balancing capacitors and
it worked just fine.
My "Everyday English Dictionary" says a meshdiode is a device attached
between two wires, could be almost any diode, perhaps we should start
trying out 1N34, instead of those modern type 1N60 or 1N270(?).

My advice is: Print such information in April issues only, then most
of us will have a real understandig what it is about

The ARRL has a complete QST index going back to 1915. It's accessible
via the members-only portion of the ARRL website
(http://www.arrl.org/). Alternative, it can be installed in your
computer -- in segments, as you buy the corresponding CDs -- with the
QST View (QST on CD-ROM) product.

1000 uF / 15V Sprague axial 2.25" X 7/8" N. QTY 2 $1.00 each

885 uF / 20V MEC radial 1.5" X 1" N. (QTY 2) $1.00

500 uF / 40V National Cap axial 1.5" X 5/8" U. (QTY 2) $0.50 each

40 uF / 450V Planet radial 2-7/8" X 1" U. $1.00

22 uF / 450V Xicon axial 1.25" X 5/8" QTY 2 N. $2.00 each

22 uF / 350V Nichicon axial 1.25" X 1/2" QTY 2 N. $2.00 each

20 uF / 450V Aerovox axial 2.25" X 1" U. $1.00

16 uF/ 600V Sangamo 3/4" dia. screw-mount w/screw 4.5" X 1.25" $3.00
(SOLD - James Lueck)

12 uF / 450V Beaver 1.75" X 0.75" QTY 2 U. $1.00 each

PAPER Capacitors: (Lot #1)
0.1 uF / 400V Sangamo Type 33, QTY 4, U. $0.50 each

Or take all capacitors in Lot #1 for $50.00

Electrolytic Capacitors (Lot #2)

8 + 8 uF / 475 V and 10 uF / 50V Philco Can 6" X 1-3/8" with bracket
U. $2.00

Mercury Wetted Relays for keying boatanchor transmitters!
By Adams and Westlake Number MW-2617-12 DPDT contacts
with diagram. Octal base - 12V DC coil 480 ohms. $5.00 each
(Same shape & size as 6L6M)

TUBES (LOT #2) (some new, mostly used) for sale:
= = = =

And for now, here is one more final lot of nice tubes:

6HS8 by International Servicemaster (New in Box) $2.50

12BE6 Silvertone, used, in box $1.00

12SA7 Raytheon (QTY 2) Used $1.00 each

6GH8 Zenith, used in box $2.00

50B5 RCA, used in box $1.50

5965 G.E. Used in box $1.00

OA2 RCA - new in box $2.00

6719 Sylvania NEW in box (Rare pencil tube) $5.00

6BN6 by Capehart used, in box $3.00

6CB6 Philco, used in box $1.00

6KT8 by G.E. used, in box $1.00

6146 Raytheon Used in box $8.00

6146 RCA used in box $8.00

Or take the 14 remaining tubes above for $32.00
(Please mention tube Lot #3)

= = = = =

ARRL Handbooks:
1975, 1978 at $10.00 each
Both in good to excellent shape

National TMK-50 Variable capacitor New In Box $15.00

Plate variable transmitting capacitors:
50 pF 800V Hammarlund 1.5" deep, 1/4" shaft, clean used $5.00
140 pF 1000V 1.5" deep 1/4" shaft New, unused $8.00

Collins 20 Watt Modulation Transformer, BRAND NEW! $40.00
Made by CHicago Transformer Co. Has 1:1 ratio: 6000 ohms to 6000 ohms
with
3000V test voltage. Part number 677N201

Thordarson transformer - THORDARSON D161916
power transformer 120 V AC primary potted, square - has two
secondaries:
Sec 1: 700V c.t. at 250 mA. 5.78 H, 48 ohms (24+24 ohms DC)
Sec 2: 1580V at 20 mA. 23.6 H, (605 ohms DC)
Approximately 4.5" X 4.5" x 4" Good for about a 175-200 Watt plate
supply. Will sell for $20.00

Tube Manuals:
RCA Receiving Tube Manual RC16 Good cond. $10.00

RCA Transmitting Tube Manual (Missing cover) 192 Pages
Good condition. $10.00

Four Nifty Books:
RCA Solid State Hobby Circuits HM-92 (397 Pages) Exc. cond. $8.00

Television For Radiomen, by Ed Noll. 340 pages, illustrated
1962. Front cover torn a little but otherwise very good $3.00

TV SICK? Service your own TV, by Belmont TV Co.
33 pages, plus sale flyer, 1975 MINT $2.00

METHODS OF TEACHING SHOP AND TECHNICAL SUBJECTS by Leighbody & Kidd
College text, 201 pages, excellent condition $3.00

All four books above for $13.00

Hallicrafters Manual:
HT-46 $8.00 each (repro)

UNIVERSAL Three station FM Wireless Intercom. REDUCED!!
Household system, plugs into any AC outlet. About 1 year old, and
in perfect condition. Three channels. Clean signals, mint condition.
Use them anywhere your house! $40 for the set of three identical
units.

3631. NE602 question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-31 00:00:00 UTC
From: Jim <jbolinger@Nloisnptaemk.com>
Message-ID: <37022839.0@news.netwalk.com>
Source record: 71778

I have been looking at how the NE602 works and was wondering if anyone has tried this:

The normal RF inputs to the mixer are internally biased and the 'instructions' say to not make any DC connection to ground or it will upset the bias. Would it be possible to intentionally alter the bias, perhaps by a resistor from the input to ground?

My idea is to allow the oscillator to pass thru the mixer, essentially using the mixer as a buffer stage. This would permit the construction of a QRP CW transceiver using only 3 active components (NE602, audio amp, RF final amp). If surface mount components where used it would be quite tiny.

I also think that it would be possible to build a AM mode transceiver using this method---feed the microphone audio thru the audio amp to the input of the NE602 with the mixer slightly unbalanced---although the necessary switching may be too bulky.

This is one of the more thought-provoking topics lately. I am not much of a kit builder because I was born blind and you have to read the schematics and instructions to know where all those parts go.:-)

I do like to build things, however. My favorite medium is perf board, wire wrap, and solder for audio and or digital projects. Hooking up an IC involves writing down a wire list of the pin-out which I do in Braille as well as any essential notes such as voltage requirements, etc. I am not the only blind person who does this at all and I am sure there are those who can do a lot more, but IC's have made home-built stuff a lot easier to build now because all you really need to know is what pins go to what and such important things as operating parameters like maximum load or the input voltage range.

Most (but not all) IC's have either a notch or a little pin-prick dot over pin 1 or between pins 1 and whatever the last pin is which is usually cut or molded in to the case so it can be felt which helps greatly in putting it into the socket right. I hate the ones with a tiny dot over pin 1 and a slightly bigger one over the other end. I have smoked a few of those by putting them in backwards and it isn't pretty.

I have an old multimeter which was manufactured in the early seventies which uses a Wheatstone Bridge whose output is fed through a chopper and a little audio amplifier. There is a scale of raised dots and a knob with a pointer. When you turn the knob and reach the correct reading, the buzz nulls out. I also have a much newer Radio Shack talking DMM and one of their DMM/frequency counters that can be connected to a P.C. I also use an audio signal tracer for lots of things.

Schematics don't really work very well in Braille because the degree of complexity of the line drawing would be kind of like trying to follow one piece of string in the world's largest twine ball.

As for building equipment in cases and chassis boxes, I sometimes will cut a piece of cardboard the same size of the cannel i am about to butcher and test the layout on that. If it will work, I then use a center punch and go on through the cardboard to the metal and make my marks to keep the hand drill or drill press from crawling away.

I am no master craftsman, but it is a lot of fun.

Obviously, because of the short carrier lifetimes, you have to use a lot
of PIN diodes in series at HF.

The newsgroups are for discussion, not for greedy bozos to drop a poopy
for selling their products and then go away.

This particular "richcom" chucklehead seems to think the newsgroups are
his own personal advertising ground. Considering the amount of equipment
he's been selling here and in a spamful of other newsgroups, he's either
a dealer or someone who inherited Barry Goldwater's ham shack.

Bill,

Great story and great pix at the website! I wonder if anyone has collected
those Jean Shepard stories.

So there's two kits that were "built twice".

A VF-1 was my first VFO. Used it with a DX-20 - worked OK on 80 and 40. Tough
to zero beat on CW, though.

I think the high power reading comes from measuring both the frequency and the harmonic. Get rid of the harmonic and the power reading will go down. Are the coils on the three hand wound torus inductors squashed together as much as possible? Also, look for a burnt out capacitor in the filter area or a shorted out inductor in the filter area.

Those are my best guesses right now.

I'll take a look later on. The coils are "squashed"; I tried messing with the number of windings, and it seems to run best with 13, if I remeber correctly--which wasn't the right number originally. I've also noticed that all the tuning coils (the cans) are very close to their stops--fractions of a turn from each.

Before I blew the radio up, I never was able to hear the sidetone; now I can, and it took turning all the cans to figure that out. I forget which one it was that brought the sidetone to life; it was something like the can for biasing the driver for the final, or somewheres in that area. I probably should have taken some notes on what was going on.

Anyhow, I was kinda looking around to see if anyone else had similar problems, and had figured them out yet. Thanks for the response.

I am restoring an old 7" electrostatic deflection TV set, and I need to replace the vertical deflection coupling capacitors. They are huge, old

waxed paper types - .05 mfd @ 6000 volts - because of the low 60 Hz vertical sweep frequency. I can't seem to find anything suitable, and I would rather not series/parallel a whole lot of smaller ones if there is something better.

Any suggestions?

Thanks, Al - K8EUR

3650. HOW TO: Calibrate SWR/Watt meters

Thanks for reading this post. I am looking for a procedure for
calibrating HF SWR and watt meters. I have a good idea on
how to cal. the SWR portion, but the watt meter would require
a calibrated RF voltmeter to read the voltage across the load
resistor. There are RF voltage probes you can build in the
1995 ARRL handbook, but how do you cal. those? I need
a simple standard of some sort. Ideas?

Personally, I like the fact that those who
place items on ebay also drop a note here.

It gets my attention and if it something
I am interested in, I go look at it.

the convention of having the [FA} ahead
of a listing here on the newsgroup is
an easy way for those who DON'T like
such postings, to be able to ignore them..

Trish

Perhaps I did not make it sufficiently clear as to my idea.
My suggestion was to use NE604/614 instead of NE602

>I also think that it would be possible to build a AM mode transceiver using
>this method---feed the microphone audio thru the audio amp to the input of
>the NE602 with the mixer slightly unbalanced---although the necessary
>switching may be too bulky.

I thought it was an idea to be able to receive AM as well as send it,
using my idea would provide a quality demodulator particularly good
for selective fading

3662. Food for thought

Newsgroup: rec.radio.amateur.homebrew

It's tough, but once in a while I can tear myself away from the newsgroups and just think for a bit. And when I do, the wheels really turn! Here's what I came up with this time, some food for thought.

Years & years ago, I was getting set to put up an inverted vee antenna. I looked in one of the popular handbooks for advice, and it cautioned me to make sure the included angle was at least 90 degrees, otherwise "severe pattern cancellation" would result. Wow. Of course I made sure the angle was at least 90 degrees. Or at least almost 90 degrees. But you know, that's nagged at me all these years, so I did some more thinking about it. Sure enough, if you move the wires closer and closer together, the antenna looks more and more like a transmission line. In fact, you could say that the transmission line mode begins overwhelming the antenna mode when they get really close. And transmission lines don't radiate. Well, I whipped one of these up out of curiosity, with an angle way less than 90 degrees, to see what would happen. Sure enough, when I transmitted nobody came back, even though I made a really, really long CQ (I don't know, maybe 50 CQs, then signed my call a couple times). So if it was putting out, somebody must have heard me. I checked the power going into the antenna, and there was plenty of power going in. But nothing coming out. So where the heck was the power going?

Now, we all know that when the patterns reinforce, you get more power. Like, 6 dB gain means that you get 400 watts out for 100 watts in. (One of the big name writers said this in one of the magazines not long ago, so I know it's true.) So what if the patterns cancel? What am I getting out for my 100 watts in?

If you don't know the answer to this, you obviously never took thermodynamics. The second, or the first -- anyway, one of the laws -- says you can't win. So there's got to be less than 100 watts coming out, but it can't just disappear. Just think about it. If the patterns add, you get more power, and that's energy, right? So if they cancel, you have to be getting negative energy. Positive energy makes heat, so negative energy has to make cold. That 100 watts of positive energy is making cold, negative energy! Now, some pointy-head Ph.D. is going to leap up any second and yell a bunch of stupid objections. But shoot, even a Georgia farm kid knows that YOU'VE GOT TO PLUG THE DANG REFRIGERATOR IN. Anybody with just plain common sense can see that it takes positive energy to make things cold (negative energy). Bet you never stuck a six-pack in the refrigerator and had electricity come out of the 'fridge plug while it cools off! Duh! No, you've got to put the positive energy in to get that negative cold energy into the beer.

So there we have the no-moving parts refrigerator. It's a great Field Day accessory. And I'm the first to discover it. Nobody else even thought of disregarding the learned advice and making the inverted vee with a really skinny angle. If you don't have any wire handy, you can just hang the beer off the back of your beam. Or maybe the side would be better. Whatever.

After making that great discovery, I had to take a break to calm down, so I started fooling with one of those computer programs that tells how an antenna will work. I was just about falling asleep slogging through a boooring example, when something jumped right out at me! Here was what looked like a plain dipole in a back yard, but its gain was 6.82 dBi! Whoa! Well, that shows how dumb these programs are. But I have a friend that has 'em all -- ELNEC, MININEC, MN, NEC-2, EZNEC, MININEC Broadcast Professional -- even NEC-4. They all said the same thing! So in desperation he dug out ol' Sterba's favorite tools, a dull pencil and slide rule. AND GOT THE SAME ANSWER! Now anybody knows the gain of an ordinary dipole is 2.15 dBi. So this thing has a gain of 6.82 - 2.15 = almost 4.7 dB greater than a dipole! And it looks just like one. Of course it can't be an ordinary dipole because it's got gain. But I don't think I'm the first to discover this one. This must be how some of those big guns put out such a gynormous signal while running only 1.5 kW. They've figured out how to make beams out of these special dipoles, and are keeping it a secret from us. Boy, if they ever figure out how to make amplifiers, it's all over for the rest of us. Just the other day, I saw a posting on the homebrew newsgroup where a guy wanted to buy a 3 kV, 2A transformer (or was it 4kV, 1.5A -- I forget). Anyway, he obviously doesn't know how to make an amplifier with more than 25% efficiency. But boy do those guys know the antenna secrets!

Well, I thought up a couple more great ideas, like how to make a 3-element beam with 3 s-units gain over a dipole (both in free space), and how to make a super broadband antenna with good SWR over the whole HF band and beyond without a tuner or adjustment. But my fingers are getting tired and my throat's getting dry, so I'll have to leave those for another time.

So until next time, keep your wires in the air!

A. Guru

Source record: 71726

I have one of these radios; I blew it up a while back and replaced the IC's and the final transistor. Works ok; seems to be really cranking out the power now, but that could be just a really messed up measurement (my R/S SWR/Pwr meter indates 5~6W, but at 12V, the radio is only supposedly drawing 600m or 700mA). Anyhow, I've noticed that the second harmonic is pretty strong, and that the output seems to be not filtered very well. I plan on putting in a low pass filter (I'll just use the stuff in the ARRL book for that), but I'm wondering if anyone else has experienced that sort of problem.

Wind a tranny on toroid to get the appropriate voltage swing on the
grids. Use swamp resistor so max output on the TX you plan to use
will not exceed linear region of grid swing. Bias tube(s) as per data
sheet. You can do this for parallel or push-pull depending on what
sort of tank you want to mess with. You can use air wound tranny
if you only want one band.

Hi gang, I am in need of a very simple cct for a 455kHz BFO.
Perhaps using a Colpitts or Hartley Oscillator or an IC (?)

This is to couple to a shortwave converter for an AM car radio that I
built.
A kit is NOT an option. Must be built by me. Fewer components the
better.

Thanks!

I have a *new* Bird 43 that I bought about a month ago. It has the 250 W and 1000 W elements for 2 to 30 MHz. I have
compared it with recently calibrated reference equipment and it has been found to be accurate as closely as I could read
the meter. The guaranteed accuracy is 2.0 percent of full scale, which is about 0.1 dB. At below full scale the scale
spreads out (easier to read), and my measurements were accurate as closely as I could read the meter over a wide range of
meter readings. The accuracy was the same in both directions.

As others have said, borrow a meter and check yours against it.

However there was an article in one of the magazines some years ago
on using a dummy load in water and measuring the temperature rise.

I would suggest that you take a dummy load and wrap insulation around
it. Then put DC into the load and measure the temperature rise and the
time it takes. Compare that to the temperature rise and the time with
RF into the load.

I leave it as a learning exercise for you to do the math.
(when you figure it out let me know too)

>the forward Voltage level of the diode and improve linearity ??

There was an article in HAM RADIO November 1987 (Page 65) which shows a
surprisingly simple and elegant way to correct the nonlinearity in an RF
detector diode. It used low cost, easily available parts.

The design worked from less than 70 millivolts up to 3 volts RMS, which
is a respectable range. Particularly when you can apply attenuators to
measure higher power.

Yes, but one can always go to their web site if one wants to buy or peddle something. E-Bay is so tacky, commercial, and so often disreputable (sufficiently so that the commercial banks refused to back the original IPO), that I hate to do anything to support it.

3674. FS: Wirewd., noninductive res., more (long post)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-02 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <3704DCB8.2757@pop.valley.net>
Source record: 71585

Components for sale (updated March 31, 1999):

Hello--
Attention, builders-- I'm offering NOS (i.e., unused) resistors of assorted types: Allen-Bradley carbon comps; wirewound; noninductive; adjustable; and more! Terminal strips (six lugs) and capacitors, too.

****
NOS boxed wirewound power resistors: $3.00 each

All Clarostats are rated for 50 watts (but see note)

Clarostat p/n	Qty. Avail.	Resistance	Type
VP50K	2	30K	Fixed
VP50KA	9	35K	Adjustable
VP50KA	6	40K	Adjustable
VP50KA	1	50K	Adjustable
VP50KA	4	60K	Adjustable
VP50K	6	75K	Fixed
VP50KA	3	80K	Adjustable

Ohmite p/n	Qty. Avail.	Resistance	Type
D100K10R	2	10 ohms	Adjustable 100 watt
D100K10R	3	3 ohms	Adjustable 100 watt

209L25J3K0 8 3000 ohms Fixed 25 watt (type 270)

****
NOTE: power rating for adjustable resistors applies to entire resistance element. If you use 25 per cent of the resistor, power dissipation in that portion derates to 25 per cent of 50 watts, or 12.5 watts.

****

Noninductive resistors FS-- Caddock MS281N type:

10 ohm +/- 5 per cent tolerance, 8 watt noninductive power film resistors

Tinned axial leads (0.75 inches long) are formed for PC-board insertion on 1.2-inch centers. These are NOS, bulk-packed parts.

Note: these measure well within tolerance at +/- 0.2 ohms typical. Full specs are available in PDF format on Caddock's web site (www.caddock.com)

but highlights are:

--Temperature coefficient of resistance: 50 ppm;
--Power rating: 8 watts at 25 C, derating to 4 watts at 150 C and
0 watts at 275 C;
--Noninductive design: serpentine film layout cancels magnetic field-
equivalent inductance of a straight piece of wire of the
resistor's body plus lead length.

Applications include:
--Current sampling;
--Cathode bias;
--Dummy loads for audio and RF applications.

Price: $1.50 each ($12.50 for 10 pieces); only 90 pieces available

****
More noninductive resistors m'fd. by RCD Components, Inc.:

RCD 135X-15-5% 3 watt, 15 ohm +/- 5 percent axial leads. Max. inductance
200 nH. $1.00 each, $10.00 for 12 pieces); 376 pcs. available.

****

Lower-wattage wirewound resistors:

RCL Electronics:

RCL p/n Qty. Avail. Resistance Type
-------- ---------- ---------- ----

RCL1307 28 200 ohms +/- 5 percent Fixed 3 watt axial
RCL1307 23 900 ohms +/- 5 percent Fixed 3 watt axial
RCL1308 105 1500 ohms +/- 5 percent Fixed 3 watt axial
RCL1307 49 4000 ohms +/- 5 percent Fixed 3 watt axial

M'fr. unknown:

207022 115 2000 ohms +/- 5 percent Fixed 3 watt axial

Dale CW2C-14 300+ 20 ohms +/- 5 percent Fixed 3 watt axial

****

Rockwood wirewound resistors: 1.8K +/- 10 per cent tolerance, 3 watt

Tinned axial leads (1.5 inches long) are formed for PC-board insertion
on 1.0-inch centers. Resistor body is of square construction. These are
NOS,bulk-packed parts.

Use for general-purpose voltage division, screen current-limiting or
wherever a resistor with more power-handling capability than a 2-watt
carbon composition resistor is required. Definitely not in Caddock's
class, but these are a basic barrel-of-nails resistors.

Price: $1.00 for 10 pieces ($8.00 for 100 pieces); several
thousand pieces are available!

****

Allen-Bradley Carbon Composition Resistors

Wattage	Qty. Avail.	Resistance	Type	Price/pkg.
2.0	2 x 25 pcs.	18 ohms +/- 5%	RC42	25/$4.00
0.5	2 x 50 pcs.	1200 ohms +/- 5%	RC20	50/$4.00
0.5	5 x 50 pcs.	33000 ohms +/- 5%	RC20	50/$4.00
0.5	30 x 100 pcs.	100000 ohms +/- 5%	RC20	100/$6.00

Note: all carbon-composition resistors tend to shift value during
storage (e.g., the 100K resistors listed above measure from 5 to 10
percent higher than nominal) and may require a stabilization bake to
return within original tolerance.

****

Allen-Bradley Potentiometers, p/n WRA16040F504U

500K +/-10 percent, 1/2-watt, 350V max. element to case, linear taper.

Mount in std. 1/4-inch hole via threaded bushing (nut and washer
included). Shaft measures 1/8 inch dia and is 3/8 inch long (1/4 inch
half-round to accommodate knob set screw (knob not incl.)

Price: 5 pieces for $1.00 (approx. 500 pcs. available)

****
Capacitors: 0.068 uf +/-10 percent 100V, tubular plastic-wrapped
metallized-polyester construction, AWG≠24 axial leads. Snazzy yellow
color (in at least two different shades)<g>.

Packaged 48 pieces per bag. Available for $2.00 per bag

****

And... yet another offering of these ever-popular six-lug terminal
strips, similar to Keystone's p/n 825: six isolated, tinned steel lugs
mounted on a brown phenolic insulating strip, arranged in groups of
three on either side of a central mounting bracket.

The lugs are spaced on 0.375-inch centers; mounting bracket has a
0.140-inch hole (use a 6-32 screw for chassis mounting).

Prices: $8.00 per 100 pieces, $15.00 per 200 pieces, $45.00 per 1,000
pieces plus $10.00 for priority-mail shipment. (U.S. only).

****

Postage: add $4.85 for insured U.S. Priority mail shipment for orders up
to $50.00 (except 1000-piece terminal strip orders). Please inquire for
postage charges for larger quantities or if you're purchasing from

outside of the U.S.A.

I accept payment via personal or cashier's check or money order drawn in U.S. dollars and made payable to "Brad Thompson".

Warranty policy:

If you purchase these components and find them unsatisfactory upon your inspection, notify me within seven days and return in as-received condition for a full refund or replacement (if available).

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

Hi,

have a look at Faisyn (http://members.aol.com/faisyn/faisyn.htm). This shareware program allows the design and simulation of passive lowpass, highpass and bandpass filters (top C coupled BP, standard BP) with lumped elements and filters with distributed elements (parallel coupled line BP, SIR distributed BP). Output format is SPICE, MMICAD and TOUCHSTONE.

mentioned some AGC improvements in DUBUS (1989?) for this rig, quite
often one believes that AGC is the problem, but sometimes one discover
that the problem is product detector dynamic range
So did LA7BI, and says it is quite simple modification to improve it,
"Q13=�PC1037 has too high operational voltage, should be reduced to
+6V by indreasing value of resistor R83=56 ohm to 120-150ohm, not sure
how critical the value is"
I had similiar problem in 1976 with Kenwood TR-7010, believed the AGC
could be improved, and had some success with some changes, but later
found a way to improve the product detector, and AGC modifications
were not so important any more

> such postings, to be able to ignore them..

The convention of playing nicely with others and obeying rules that were created to make the newsgroups possible and to keep them usable is much more important to most of us than setting up special conventions for the rulebreakers to break the rules with impunity.

ebay's continued insistence that its users drop these poopies in the newsgroups has generated literally BILLIONS of copies of advertisements, carried around the world to displace topical messages that truly belong in these newsgroups and to cut down on the discussion the Usenet groups were created for and are maintained for. If you want to see what's on ebay, GO TO EBAY.

Personally, I don't think 95% of the FA or EBAY postings on the NG cause any problem at all, if they mention equipment that would normally be sold/traded/bartered on the newsgroup anyway.
I do agree that the "updates" of ... three hours left on this one ... get a little ridiculuous, but we're only talking about one or two people who do that. As many people have mentioned, you can filter out the AUCTION or FA subject lines if it bothers you that much.

The little "typewriter pictures" and cutesy quotes and phrases at the end of dozens of NG posts consume much more space and are far more irritating than any one paragraph auction notice. Just my $0.02.

Reg,

As a rule of thumb, here in Southwest Florida, the "driving impedance" depends largely on the time of year, and which road you attempt to negotiate. From December to April (peak current), "peak rubbernecking folks" (Peak RF Volks) exceed capacitor dielectric limits, and cause severe arcing of the drivers. Once the excess RF are shunted to ground (Home to OH, PA, NY, ON on I75), and the capacitors restored (new bridges built, roads resurfaced), the driving impedance returns to specs, until the entire circuit overheats in July, causing local oscillations, and forcing the addition of cooling fans. As the sunspot cycle wanes, and operators use more power to compensate, the cycle begins anew, only this time, larger capacitors are wired into the circuit, to handle the increased load. ...

<crrandal@seidata.com> wrote:

How to calibrate a homebrew power meter?

How accurate do you want to be? For starters, bypass any coupling capacitors at the input to your power meter and apply a DC voltage. Measure the DC voltage with as good a voltmeter as you have and that should be pretty close for relatively low frequencies, relatively meaning compared to frequencies where the parasitic reactances in your power meter begin to be important. Or, borrow a Bird wattmeter and compare readings to it. I did that with a couple of SWR meters I had and was pleasantly suprised to discover that they were pretty close. The principle source of low frequency inaccuracy in RF measurements is the voltage drop across the rectifier diode. You can calibrate it out if you know what kind of diode you have, Germanium or Silicon. The ARRL Handbook has some information on building RF measurement gear.

Good luck, have fun!

The best approach of all is to locate someone who has a Bird Model 43 wattmeter that you can borrow for a day or two.
Just be sure the Elements are correct for the frequency range that you are interested in.

One of the best FREE oscilloscopes I've found can be downloaded from:

http://polly.phys.msu.su/~zeld/oscill.html

Once you figure out how to kick it into frequency domain, it becomes
very useful for analyzing audio waveforms such as heterodynes from
international broadcasters for frequency checks on a rig. It will also
show sub audible tones on an FM repeater signal.

>Dave K1MBO

Re the error due to forward voltage drop and non linearity under and around the point of conduction for Germanium and Silicon diodes, anyone know if its workable to set a steady DC current through the diode so that it is well in to conduction. Would this enable one to measure very low RF voltages below the forward Voltage level of the diode and improve linearity ??

3693. IC / Discrete MASTER CD-ROM Wanted

Al,
The Newark catalog shows several styles of HV caps made by Plastic
Capacitors. They aren't cheap, but they should do the job, and
you can buy in small quantities with a credit card from Newark.
A 10 KV 0.05 uF cap (OFN100-503) is $77.71 in the catalog.

It looks to me like paralleling a bunch of 6 KV ceramics wouldn't be
much cheaper, unless you already had them in the junk box.

>However, I must admit I've never tried to mate the two.

They were never *intended* to mate, but they will provided they are
the same impedance. The center pins of N and BNC connectors of
the same impedance are the same diameter, and the grounding rings
of each style are the same diameter. What's different is the mechanical
locking feature of each style. That's irrelevant electrically, of course.

It is common practice to simply *push on* a N male into a BNC female
on a piece of test equipment. As long as the impedances are the same,
it works. You wouldn't want to do this for a permanent connection of
course. Where you run into trouble is doing this with a 50 ohm N male
on a 75 ohm BNC female. The female pin will be damaged, and you'll
curse when having to replace the connector on your piece of test
equipment.

>Secondly, I think you're partially mistaken about the pin diameters on
>the 50 vs 75 ohm connectors, at least in this respect: The MATING
>(i.e., contacting) portion of the connectors is the same on 50 ohm vs
>75 ohm connectors of the same series. Behind the mating portion
>(where the soldering or crimping is done during assembly to a cable)
>is indeed different. Therefore, you should never have to worry about
>mating any BNC plug to any BNC jack, or any "N" series plug to any "N"
>series jack.

No, the diameters *are* different. Both the N and the BNC are constant
impedance connector designs, so the pins have to be different diameters

for different impedances. In a TV broadcast plant we have a mix of 50 ohm
and 75 ohm connectors, and we have damaged connectors on test equipment
to prove that people *will* try to push on the wrong impedance connectors.

There's a milspec on this. I looked it up one time and posted it in our
shop to try to get people to not mix impedances. Didn't work. We still
get damaged connectors on our test equipment from time to time due
to this practice.

Source record: 71676

Reactance of L at 0.243 MHz = XL = 4361 ohms

Parallel impedance of tuned circuit = Q*XL = 741,300 ohms.

Turns ratio = Squareroot (741,300 / 50) = 122

Turns on link (secondary) winding = 150 / 122 = 1.23
turns Very closely coupled.

So use 2 turns not very closely coupled.

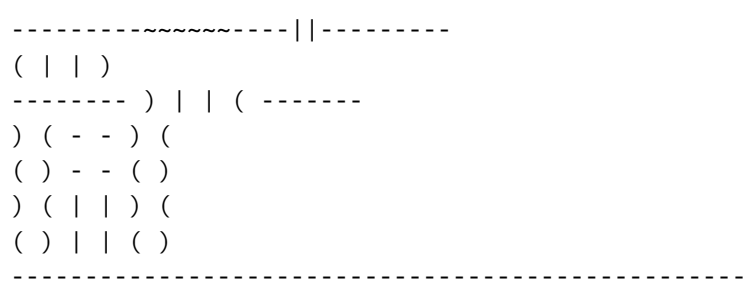
>--



Here is one I designed many years ago that worked quite well. The turns ratio on the 2 tranformers is 2.5, the secondary inductance is 2.5 mHy, the resonant cap is 15 uF, the series inductance is 79.6 mHy and the series cap is .5 uF. I don't remember the # turns or the core sizes but the inductors should be made from reasonably large toroids or pot cores.

This gave a 3 dB bandwidth of 200 Hz and was 500 Hz wide at 30 dB down.

and before you start, check that FSD appears with same power level
with SWR meter connected one way and the opposite
Have built some VSWR and power meters for 35 years, and have bought
some commercial power meters, OSKERBLOCK and Bird Model 43, none of
them are very accurate, including Bird model 43, but it is usually of
very little importance whether the power is 90 or 100W. Read the
instruction book for Bird Model 43 thoroghly to get a better
understanding of which levels the meter shows. Believe Marconi
Instruments 2955 is quite accurate for VHF/UHF, but it costs at least
ten times as much as Bird model 43

I've seen some restoration jobs that were clearly more work than building an
equivalent unit from scratch. Every part restored, (and many remanufactured),
junk units cannibalized, ancient technologies rediscovered. Great stuff. Love
to see a classic saved from the landfill and restored to its former glory.

You are to be congratulated, sir.

Hi all and thanks for reading this,

I have an Alinco ELH230g 2m SSB/ FM Linear that I picked up locally at a ham fest with the view of sticking it on the back of my FT290R Yaesu.

I was told that the final was blown when I bought it, simple I thought just replace the final. Problem is I cant tell what the final is, as the letters and numbers have been worn off and I have not got a schematic.

Can anyone help with identifying the offending part?

Please e-mail me direct as I don't visit the news groups often.

Thanks in advance

Hi,

I propose you a new program, it will not interfere with any thing else your doing, but will make you a ton of
money. This is the most creative program out there and it just started March 4th. I've talked to the developer
and the marketing director of this program and its the real thing! This is brand new! Act quick, you are one
of the very first people to see this program and its HOT!

Best Wishes,
Michel

ANNOUNCING AN ALL NEW CONCEPT!
****
INTRODUCING. . . .

Finally! A legitimate program so simple you can literally make thousands of dollars
in the next few minutes with the power of the Internet!

****

WHAT IF, you could literally make one short and simple phone call to an automated system, receive a pin number, and be able to simply "Point and Click" your way to several thousand dollars in the next few minutes?

WHAT IF, simply by sending this same exact E-mail to as many people as possible you could earn $2.00 per caller referred by you for an ENTIRE 7 LEVELS?

WHAT IF, by making this call, this program, contributed a large percentage of revenues to several different Charitable Organizations?

WHAT IF, after making the call you were able to access a website, which would allow you to:

Track your earnings (You will be able to view your entire 7 levels and always know, to the minute, how many people have made the call in each of your 7 levels)?
View the list of charities that have already received contributions?
Receive a lifetime membership to place quality classified ads on our website at no extra cost?
Access over 1700 reports, business tools, legal forms, documents, and educational material at no extra cost?
Purchase computer and other products at a HUGE discounts?
And also provide a means of communication between you and the Program Team?

WE ARE VERY SERIOUS ABOUT YOU MAKING MONEY!
WE HAVE THE MARKETING PLAN TO DELIVER SERIOUS CHECKS AND YOU CAN EARN THIS MONEY FROM THE COMFORT OF YOUR OWN HOME AND FEEL GOOD ABOUT HELPING US RAISE MONEY FOR CHARITY!

HERE IS WHAT WOULD HAPPEN IF YOU ONLY REFERRED 10 WHO REFERRED 5 WHO REFERRED 5, etc. FOR 7 LEVELS:

Of callers in level 1 = 10
Of callers in level 2 = 50
Of callers in level 3 = 250
Of callers in level 4 = 1,250
Of callers in level 5 = 6,250
Of callers in level 6 = 31,250
Of callers in level 7 = 156,250

Total in all 7 levels = 195,310 X $2.00 = $390,620.00 (paid to you)
And all you did was get 10 people to make one simple phone call! Think about what could happen if you actually advertised!

ADVANTAGES:

NO FORMS TO FILL OUT OR SIGN

NO DOCUMENTS TO MAIL OR FAX

NO CREDIT CARD INFORMATION REQUIRED

NO CHECKING ACCOUNT INFORMATION REQUIRED

YOU CAN LITERALLY START MAKING MONEY IN JUST A FEW
MINUTES FROM THE TIME YOU PLACE THE CALL

THERE IS NO INVENTORY TO STOCK OR SELL

THERE ARE NO MEETINGS TO ATTEND

THERE IS NO NEED TO CALL OR TALK TO ANYONE

THERE ARE "NO" MONTHLY OR ANNUAL DUES OR FEES

AFTER PLACING THIS ONE CALL, YOU NEVER PAY ANOTHER CENT, EVER!

Here's how the program works:

1. Simply call a number I will send you if you are interested . Cost of this call is a ONE-TIME flat $35 which is billed to your phone number or if you would rather charge it to your Credit Card you may do so at a web site I'll send you and register without making the phone call. This will NOT switch your long distance service! There is NO, "per minute" charge!

2. You will be issued a pin number which will allow you to register at the web site, so be sure to write it down correctly.

3. After placing the call you will need to go to web site and register so that you can receive your ID #.

4. When you go to the Web site to register you will be asked to enter the pin number you received from the automated call system so be sure to write it down correctly (if you are using a Credit Card this pin # will NOT be necessary).

5. You will also be asked to enter the following referral code while registering:___32914___ (this is the ID # of the person who referred you to the program). It is very important to enter these numbers correctly so please double check all numbers!! Use the above referral number only ! The
referral number at website is for demonstration only !

6. Before sending this E-Mail to anyone, make sure that you replace the referral code in step 5 with your ID # which is the number you received while registering. Once you have done this, simply send this letter to as many people as possible! It is not necessary to have a computer to participate in this program. You will only need to access a computer to register.

7. Go to the website regularly to track the number of calls placed under your ID # by clicking on "View Status Report" in the "Members Section" and watch it grow before your very eyes!

IT'S THAT SIMPLE!

This is still a new program but calls are flooding in!
So HURRY and make the call and get registered while this is still a ground floor opportunity!

"Good things may come to those who wait
but only the things left by those who hustle"
Abraham Lincoln

Hello Al,

Sprague model number 6GAD47 is a disc ceramic that is rated at .047uF at 6kV. Should be good for your application. These caps can be ordered from any Sprague distributor. If you have trouble finding a conventional source, try Henry Radio as they use this part and its higher voltage 10kV 'brother' in some of their power amplifiers. Henry wants about $10 each plus s/h.

Good luck and 73,

Glenn KZ7R

Hello--
Depending on the age of the car radio, you may need a 262.5 KHz BFO--
older radios used this lower IF for better selectivity.

Probably the best thing to do is to post your question, and whoever feels qualified to answer it will do so.

Before you do, double-check the solder connections, and make sure you put the right parts in the right places. (take special care with resistors that have red and/or orange bands. Sometimes it can be really hard to tell the difference!) These two errors cause the majority of problems with kits.

3723. VHF mixer circuit required

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-03 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7e623f$g7v$1@uranium.btinternet.com>
Source record: 71608

I am considering homebrewing a VHF FM rx, for the 2 metre band, and possibly with provision for 6 metres. I would appreciate any help regarding the mixer. If I use ceramic IF filters and say, a low frequency VXO, tuned to some harmonic as the local oscillator, need I bother tuning the RF input stage with the LO?. Will I need a series or parallel trimmer cap across the xtal to increase LO frequency?. As far as the If amplifier is concerned, should I use 10.7 MHz or 455KHz?(I am more tempted to use 10.7 since I have a spare ratio discriminator transformer for this frequency). Would 10.7 be too high for 6 metre reception? I also intend to use discrete transistors for the IF amp rather than an IC. I am unsure of whether to use a cascode strip or seperate transformer coupled stages. Also, how many stages, or how much gain, should I expect from the IF amplifier- I dont want it to oscillate, but want good sensitivity at the same time. Your comments please!

Many thanks for your help, 73 de David.

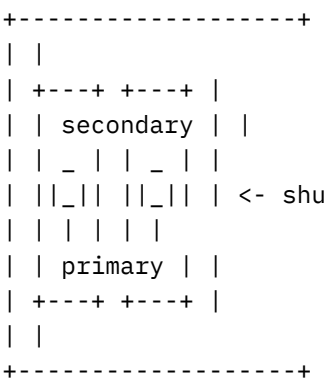
>What's a magnetic shunt?

It's two hunks of core material that goes between the primary and
secondary windings in the winding windows. (They're wound side by side,
instead of layers like most older power transformers). That gives a
path for the flux to take in parallel with the path through the middle
of the secondary.



I don't know how effective they are at current limiting , and with 2 kV
and 500 to 1000 watts running around in there, I'm really not to eager
test one to find out. ;=)

The magazine article is in Electronics Now, January 1995.

I built one about 30 years ago from a design in Popular Electronics. It used a pair or capacitive antennas, which controlled the pitch and volume respectively. I don't think I ever got anything approaching a song out of the thing :-).

You might be surprised. Things like WD40 and TriFlow aren't conductors themselves, but they unquestiionably do aid in making good electrical contact. I had to convince myself of this -- I sprayed a deep puddle of TriFlow (which is basically WD40 with Teflon) on a piece of copper-clad board, then lightly brushed a single strand of #40 AWG (or something very close to it) through the puddle. An audible continuity tester showed the connection quality to be excellent -- the wire made much better, and more consistent, contact with the board surface underneath the pool of TriFlow than in a similar test where the wire and board were both left dry. I guessed the Teflon residue would interfere with conduction once the hydrocarbon carrier dried up, but that turned out not to be the case either.

That's not to say there isn't better stuff out there, but both experiment and experience suggest that WD40 is unjustly maligned. For pots, yes, you usually have to replace them in the end. But for dirty wafer switches and such, there doesn't seem to be any real advantage to the more expensive stuff, as long as you're sure the WD40 won't attack any nearby components.

The distinction between a cleaner and a lubricant is not an important one in this case. Something that reduces the friction between two surfaces will also tend to get rid of unwanted particulates between them.

Interesting comment on the Product Detector for the FT-726R.
I never seemed to have a problem with audio distortion from the
product detetor. I did modify the AGC to "Hang AGC" which
helped tremondously for breakin work.

Chuck KD9JQ

See http://www.imaxx.net/~kd9jq for Hang FT-726R AGC, Xmit
Delay Mods.

I just saw a very interesting video about Leon Theremin and his musical "instrument," called a Theremin, which he invented in the 1930's. From what scant technical information the film presented, I gather this was a device composed of one or more oscillators, an audio amp, two antennas, possibly an RF amp. All vaccum tube electronics, 'played" apparently by using the hands around and about the device, varying hand capacitance effects. Remember the Beach Boys tune "Good Vibrations" and that wavering, organ-like sound? That's this thing.

I seek further info about this odd marriage of radio and music, possibly even a schematic. I'd like to give a shot at building one.

To: wmeara@erols.com
From: "G.Puppin" <puppin@netpar.com.br>
Subject: Homebrew

Congratulations Bill.
You have a very good page about your histoty and experiences in the homebrew field.
When you say "magic" refering to a qso made with a homebrew and low power
you are completely right. This is the correct form to express that feeling.
I felt the same way when, in 1969, I got my first contact (clandestin) on
eleven meter using a 6L6 at the rf amplifier of a homebrew transmiter and a
homebrew receiver.
I can't forget the days I spent at the attic (my lab was there) with a
regenerative receiver and a head phone listening that marvelous stations.
And the galena receiver (crystal radio) that needed no supply to make us so
happy.
You made me remind that old good days !
God bless you brother !

>http://www.erols.com/wmeara
>
Hi Bill
I was reading Dejanews and found a message with your address at the
end,
then I went to there and knew a little about you.
About the superhet, there is no doubt it is a better radio. The
regenerative is only a way of having fun with a simple one tube
receiver.
I read your spanish article and I found it very interesting too. In my
opinion this kind of article can influence positively the young guys
to
enter this beautiful and magic world of analogic electronics. I
discovered
my love for electronics, reading an article about a Galena radio when
I was
12, in a magazin directed to the people pertaining to a group called
(Legiao da Boa Vontade - Good Will Legion).
After that I did a lot of "experiments", from grafite/gillete detector
to
AM transmiters at the end of the broadcasting band (1600KHz), using
50C5
and 6V6 tubes.
There was a group of 7 guys like me, in Rio de Janeiro, that
transmited
using homebrew transmiters and small antennas (6m of wire) extended
very
near the ground (2- 3m) and we could talk at a distance of
aproximately
8Km. The receiver was what we had at the moment from 6 transistors
portable radio to tube type receiver. I used a small loop with few
turns
tuned at the frequency I was needing to listen, at the attic, where I
had
my "equipament". It was very exciting talk to a friend 8Km apart. I
could
feel the "nulling" of the loop when it was turned. The reduction of
noise
was amazing. Only that way I could talk to that friend (Jair - now he
is a
cardiologist).
Sorry to spend your time with my reminiscences.
I hope you continue with your page bringing us some of your
experiments.
The hamradios we find today need to know the pleasure of use QRP and
homebrew equipament.
That's enough.

Nice to talk to you again.
73s
God bless you.

Some time back I did a "search" in the Internet for information about theremins. There are sites with schematics, mostly solid-state designs as I recall.

The original Popular Electronics carried at least one article describing the building of a device. In that unit I seem to recall that the oscillators were controlled by cadmium-sulfide photo-resistive cells.

Rumor is that Ziff-Davis (or the owner of the "new" Popular Electronics) will be making the old, original issues available on a Web site.

There are some pages with scanned schematics, even the schematics from
Popular Electronics that Ron Cook mentioned are available for downloading.
Just do a search on "theremin schematics" in Yahoo and you'll get some
sites covering the theme.

I just designed my own Theremin, it's very simple (and still needs some
corrections, too :-), but it fits on a 9x6cm^2 PCB.

>> WD-40 -- Cleans and lubes at the same time. Used it for years as a Sony
>> Factory Service Tech and it beat everything else.

For the life of me, I don't see how anyone can have good results CLEANING switch contacts with a petroleum based lubricant. LUBRICANT is used to lubricate.... that is, it leaves a slick deposit to reduce friction of parts that tend to rub together and protect parts from air and oxidation. CLEANing solutions are designed to clean contacts; that is, remove all dirt and residue from surfaces. This is just the opposite of a lubricant. You can't have both unless you use extremely expensive conductive grease type materials. WD 40 is not a good conductor. I would not want to coat small fine switch contacts with this material.

Off-the-shelf TV tuner cleaner would be about the most easily obtainable cleaner you might find.

Personally, I have found in 30 years radio maintenance that the most reliable fix for an intermittent switch or pot is to replace it. Digikey is a good source for both.

I agree! Except stick with TriFlow. The contents have a much lower vapor pressure and the fix lasts for years. It is miraculous on pots, too. I suspect the antioxidants help. If you want a surprise, try it on motor brushes! I expected a burnt mess but the sparks disappear and the motor speeds up. I haven't seen any long-term downside yet - and I spray that stuff everywhere. :)

Hello,

You have got a lot of good informations !

Just another small suggestion, by my own experience, make sure you have no harmonic with the generator (transmitter) you are using. A low-pass filter or 1/4 lambda notch is to be put before the swr-meter.

For the accuracy of the swr scale, a good directivity of ur swr-meter is the heart, but it's sometimes (and often) difficult to obtain ... and measure !

73,
Frank.

Jeffrey Herman wrote:
>
> Give 'em a bath in denatured alcohol or acetone. Do so in an open area.

Acetone may attack the plastics in the case. Alcohol will clean some
of the grime but not all.

The idea is to clean the oxides, grime, and non-conductive film from the
contacts, and leave a lubricating layer to prevent galling of the
contacts. The lubricating layer also prevents re-oxidation and the
formation of non-conductive films that caused the problem in the first
place.

The lubricating film is non-conductive, but the microscopic asperites on
the surface of the contact will punch through the film and provide a true
metal-to-metal contact. This can reduce the contact resistance by a
factor of ten and make it much more stable.

For example, "Fix Modem Problems",

http://www.csolve.net/~add/system/modemtip.htm

shows how ordinary vaseline can reduce the contact resistance on your
telephone.

Simply cleaning the contacts may provide temporary improvement, but
without protection, the problem will soon return.

David
You could use a NE602/612 which has a built in oscillator for a cheap and
easy mixer or a ring diode (eg SBL1) if you want a more bulletproof design.

> If I use ceramic IF filters and say, a low frequency VXO, tuned to
> some harmonic as the local oscillator, need I bother tuning the RF input
> stage with the LO?.

The input could be fixed tuned for 144Mhz - ideally with something like
helical filter for best performance

>Will I need a series or parallel trimmer cap across the
> xtal to increase LO frequency?.

You will need a PLL/VCO setup for proper performance if you want the set to
be tunable

>As far as the If amplifier is concerned,
> should I use 10.7 MHz or 455KHz?(I am more tempted to use 10.7 since I
have
> a spare ratio discriminator transformer for this frequency). Would 10.7
be
> too high for 6 metre reception?

You should use an IF of about 10% of the operating freq or the image will
be a problem - certainly 455 KHz would be too low. 10.7 would be the IF of
choice (or maybe 21.4 MHz) as parts are easily available.

> I also intend to use discrete transistors
> for the IF amp rather than an IC. I am unsure of whether to use a cascode
> strip or seperate transformer coupled stages. Also, how many stages, or
how
> much gain, should I expect from the IF amplifier-

Most designs would use an IC in the IF amp (eg NE614/15). You will need if you use discrete parts to have several stages (4-6) to get enough gain (typically 100 dB in an IC circuit) There many chips around with well documented app notes (eg Signetics,
Phillips) and these would be much simpler

>I dont want it to oscillate, but want good sensitivity at the same time. Your >comments please!

Due to the high gain, layout and shielding are critical. A PCB ground plane is virtually mandatory with extensive bypassing of the power rails etc
Look in Elektor April 1992 for a 2 metre FM receiver design

Wow, some one must own stock in WD 40! In the Pro audio world, the caig cramolin r5/d5 is defiantly the way to go. I would not get caught dead spraying
WD 40 in an expensive mixing board. Leaves too much residue. I have seen boards with "customer repaired" using WD 40 with puddles of goo inside. A good
cleaner should clean and preserve. This leaves out just alcohol or other straight
petroleum products. If you clean a control in this matter, it will soon be noisy again.

Notes on cleaning switches:
If the switch is a knife type with a steel case, try to pry the back cover up to
expose the end of the switch slider. Put the switch in a vertical position and spray
D5/R5 in and work the control for 1 minute or so.
If the switch is a sealed plastic type..Do this only if there is no other choice.
Get a small shafted pencil soldering pencil. Burn a small hole with the pencil in
the back of the control. Make sure you work the control back and forth so none
of the melted plastic jams the control. Spray D5/R5 in the new hole. You then can
seal it with a dab of silicone sealer or equiv.

Will,
In my opinion, to make a low frequency transformer is more tedious and time consuming than critical. You will need a kind of device to help you turn the base used to support the hundreds or even thousands of wire turns to be wound while ou guide the wire on the several layers, manualy is very complicated.
If you realy want to try it, I suggest you to use an appropriated insulated reel that fit the core where the turns will be wound. This will simplify the task.

A transformer for a switching power supply is less tedious to wind, because it uses much less turns than the low frequency types and can be wounded manually.
The cooper strips are used when the number of turns are small (1 or 2) and

it's needed high cross-section area and small leakage inductance between the windings.

And with all the suggestions and the surprising references to WD40 I did not see the suggestion to use Silicon spray. I have a can of spray used for TV Channel changer contacts (from rotatable channel changer) and it is Silicon. Silicone has also been used in Distributor caps (when cars had them) to keep out water, lubricate and conduct electricity.

What problems are you having with the DSP-2232??? The only mod. I'm aware of is one to slightly increase the output signal, but this is only needed if you can't get the proper FM deviation by adjusting the pots. In general the unit works great "as is."

Did you make a guess at the parts required and do a quick budgetary on what the cost would be Versus a particular typical store bought transformer? I suspect that the parts would cost much more that the transformer to be built, especially if they come from a supplier like mouser. I bet these parts are sold mostly to people with critical and exact requirements for which there is not standard part available, or for breadboard use to determine specs for a custom build of a transformer in quantity.

Will OM,

I built a Theremin in early 1955. It was one of a dozen different
circuits that could be built up with an electronics experimenter's kit
from National Radio Institute, as I recall. It was simply an audio
oscillator whose amplitude and frequency could be controlled via hand
capacity from two wire leads, several inches long each. It could be
made to wail and moan, and sounded cool to a 15-year old, but I never
approached anything resembling 'music' with it, HI.

Hello--
In general, it's more cost-effective to buy or scrounge a transformer that's either close to or exactly what you need. However, use Deja News to search for recent threads discussing reuse of microwave oven power transformers. Basically, you remove the high-voltage winding and reuse the primary; also, you must remove any magnetic shunts present.

OTOH, you can easily wind small to medium-size high-frequency transformers for switch-mode power supplies or DC-DC convertors using ferrite pot cores and their matching bobbins.

The major issues in winding your own transformers are:
--Large number of turns required at 50/60 Hz for high-voltage windings;
--Obtaining proper interwinding insulation;
--Obtaining moderate to large quantities of magnet wire of required sizes and insulation type.

OC36 is in my 1964 data book, thats 35 years.
Germanium PNP Nd max 30W, Vcm 60v, Icm 6A, hfe 50.

You can design a class B push-pull power amplifier, they go in class AB
or even class A in summer by themselves because of collector/base
current leakage. I remember the first 2N3055 as a real relief.

In those days it was not unusual to see a transistorised radio become
silent just because it was left in the sun.

I would not advise more than a 12 volt 2 amp power supply to play safely
with a pair of these.

Have fun.

Will OM,

Generally, I have found after 45 years of homebrewing things that parts are almost ALWAYS cheaper than assemblies, especially those that require considerable labor. You did not mention whether you want to build a 60-cycle transformer, or a switching regulated power supply like the one in recent QST, that runs at 10's of KHz or higher. VERY big difference!
The 60 Hz ac transformer is technically much simpler to do, as it requires only the transformer, not a complete switching power supply with all of its control circuitry, fault-protection, etc. I suggest you read that switching supply article in QST through a couple of times. This will tell you how much the designer had to do to make the supply reliable. Building a 60 Hz transformer requires only the winding of many turns of wire, proper insulation layer to layer, and assembling the stack of EI core laminations. If you can find a (cheap) source for common lamination material and wire of the correct sizes, then the rest is mostly all your labor, which is, of course, free.
When winding your own, it is sometimes easier to have lower-voltage secondaries and use voltage doubling in the rectifier, to reduce the number of secondary turns required. Many 60-Hz transformers have roughly one turn per volt, just to get an idea.
If you can find one or more existing transformers of approximate power rating that you can (cannibalize) disassemble, cut off the secondary windings (which are usually the topmost windings, leaving the primary intact). Then you can wind on a secondary for any voltage you like, the

wire size being determined by the available window area left for the secondary.
It can and has been done by many.

Having said all of the above, there is another way. You can copy the basic supply in the QST article, except redesign the power transformer for high voltage at the secondary(s). The primary circuit remains the same of course. The tricky thing with a small transformer like those used in switching supplies, is insulation for the high voltage at the secondary. Easier to get turn-turn and layer-layer arcing, since the volts/turn is much higher with these transformers than 60 Hz ones.
The control loop cirsuitry may have to be modified slightly to allow for the different loop gain around the control loop, with a high-voltage secondary. Even this can be mitigated by using an additional secondary winding with the same number of turns as the original secondary but very small diameter wire, since it will deliver almost no current), and using that as the controlled output. Thus, the new secondary of high voltage, will run "open-loop", or not directly regulated by the control circuitry. This will still work, but without tight regulation of the secondary voltage, which may be OK anyway. After all, 60 Hz transformers are completely unregulated, and work just fine.
There are lots of ways to skin a cat; all have been done before, by many with little or no experience. One makes his choices... Don't be scared out of experimenting by those who only understand buying, and not making. This is what homebrewing is all about.

:

Hi Ron,

I was laughing so hard at "Bobs answer" that I almost forgot to come back... He's trying to sound like he's an amp expert, but it comes off like he's a CB amp/hack guy...

First, 4-400's are great tubes, lots of gain... I would find a late 70 through early 80's ARRL Handbook where a grounded grid construction article is printed. This seems to be the most popular method for hams to use these in newer projects.

They operate similar to 3-500z, but require the additional grid to be dealt with, in g-grid operation, both are often tied to DC/RF ground. This is refered to as triode operation of a tetrode. The cathode is driven through a tuned input for best linearity. They provide less gain in gg operation vs a pair of 3-500z.

Onward...

In true tetrode operation, they drive with much less power. Early 60's ARRL Handbooks are great places to look for the 4-400 in tetrode operation.

Very similar circuits using 4-125 and 4-250 are pretty much the same tube circuit, with lower plate diss. These tubes are "little brothers" of the 4-400. Common high gain tetrode operation, requires considerable care in construction to avoid forced neutralization requirements (feedback problems). Often this type of circuit is grid driven. Some designs allow more broadband operation (without tuned input).

Most common ham tranceivers have enough drive to allow grounded grid, triode operation of a 4-400

hope that helps....

skipp

skipp@pilot.ucdavis.edu

PS, the Kenwood TL-922 used 3-500z tubes, not 4-400's as mentioned by another Author.

I have a Cherokee AH-27F next to my computer and I need to relocate the 1/2 wave rubber ducky antenna I have for it to the outside. My monitor gives it to much static. I also want to use this rig for a car if the occasion arises, so a window mount would be preferable. What I need is a male BNC to female Coax connector or a male to female BNC connector with 17 foot or so of coax. Any suggestions would be appreciated.

WD40 *is not* an electronic cleaner and should not be used on electronic or electrical equipment. You might get away with it but why would you want to try when there are perfectly good contact cleaners available? In addition, WD40 is flammable and *could* cause a fire if you use it around contacts that may arc. My son-in-law ruined a good alternator by spraying WD40 on the armature trying to lubricate the bearings.

Radio Shack has, or another one of those companies, a rubber duckie
relocation thing--a piece of metal that will fit over the car window,
and has the coax to connect to the radio. That might not work for home,
but that would take care of the car. As for home, a more permanent
solution could be done, wouldn't have to be too fancy, maybe something
like a thro-glass antenna, or something of the sort.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I have an opportunity to obtain a Tek RM-45A scope for $45. It takes Type CA plug-ins, whatever that means.I have seen these (the scope itself) in Surplus Sales of NEs catalog for $175, so it looks like I may be getting a really good deal. Also, the unit appears to have been very well cared for. It came out of a university science lab just last January.

What should I check before plopping down my money? Can anyone tell me what the tube line-up in this unit is? I understand that the RM-45A is the rack-mounted version of the 545A, so if this is correct info, that should mean the two models are electrically identical or at least very close. It is very definitely a boatanchor, at about 50 lbs. and the size of a window-mounted air-conditioner!

This scope is more than 25 years old, so what is the price/availability of replacement CRTs should I need one in the future? I will check to make sure it has a trace before I buy it. How specifically do I evaluate the trace/CRT for quality/condition? Other simple tests and/or check points that are recommended?

That's a lot of questions, whew! Thanks for reading this and double-thanks for your replies.

Hi all I am getting to grips with pspice, ''design lab 8'' I am in the process of trying to design a small signal rf amp based on a 2n2219a transistor. Its really serving as a buffer for a vhf oscillator.

Is it possible to be able to display the impedance of a point in the circuit with markers. What I would like to do is look at the real and imaginary impedance feeding the base of the 2n2219a so as to get an idea of the best matching network to use.

I would like to graph the impedance vrs frequency..

Any help would be appreciated..

Thanks JD..

I have had good luck designing and winding 60 Hz transformers. I'd
recommend going to your local library and borrowing a copy of Reference
Data for Radio Engineers. There is an excellent chapter on transformer
design in it. It includes calculation of the cross-sectional area needed
for the power you wish to get from the transformer, correction for
various losses, etc.

There have been many good designs in QST and the ARRL Handbook for 432 MHz amps over the years.

I bought a 432 amp using 4CX250's complete with power supply at a hamfest for $15 a couple years ago. The owner was going to use it for ATV but never finished it and decided he didn't want it cluttering up his shack.

I just wonder what you are going to use it for? When you say "lo or hi band", that doesn't sound like amateur radio usage. It is illegal to use non-type-accepted equipment for any use other than the Amateur Radio Service.

3799. Another batch of diode removal questions =)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-06 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <19990406003319.28813.00003063@ng119.aol.com>
Source record: 71484

Hello folks,

I got several responses about diode removal and I really appriciate everyone of the responses! I failed to state that I was looking for removal of "surface mount" diodes, this would have narrowed the responses to the topic that I was looking for! =) Oh well, I did learn a little about both.

I was surprised to hear that some Hams actually "crush" diodes to remove them. I would imagine this is a permanent "removal", and that it would make it difficult to reinstall a diode back into its place. My question is, is it acceptible to actually crush a surface mount diode as a way to disable its function? The rado in question is a ICOM 706MKII and is out of warranty. I plan on keeping this rig for quite a long time, I've had it since 1997. It is installed on my sailboat and I am looking for a back-up rig that would be able to lend communication assistance no matter what the frequency in the case of an emergency while on the water. I am looking for extended tx capablities on Marine SSB as well as the VHF Marine band.

I am not experienced at removing items from circut boards, but I could manage to crush a diode or two.. (sounds funny) If I were aware of an experienced local Elmer that was willing to take my radio into his hands to perfrom this mod in a more conventional way I would like to stand by and watch it performed. I am still in the process of looking for someone or learning to do so myself.

Thanks again to all !

> Ed WB6SAT

Ed WB6SAT:

You are generally quite right. But....

WD-40 is cheap, and the lighter, more aromatic components of it, when pressure blown onto a contact, will do a pretty credible job of cleaning oils, dust, cigarette tars and mouse piss. And most of the WD-40 will evaporate. But yes, there is an oily residue that remains. And this residue will hold airborne contaminants very well. So, the WD-40 does a good clean-up quickly, but it leaves a residue that actually accelerates future contamination.

Now, if we're talking cleaning a switch contact, we not only want to wash away the gunk, but we want to remove the metal surface oxidation and sulfides. The metal chosen for contacts are a compromise between conductivity, melting point, hardness, and oxide formation. Ideally, you would like a contact that deforms slightly, to make a wiping action when it makes and breaks, thus breaking surface oxide skins. You would also look for a metal with a soft and relatively conductive oxides. So tin is better than aluminum.

If you want to truly clean a contact, you need to either chemically etch the contact, or mechanically abrade it. And once it's clean, then you want to slather on some compound that keeps the contact wetted (submerged in a protective goop) to prevent contact with the oxygen in the air.

Most home jobs aren't critical enough to go the full contact renewal route. I usually wash with WD-40, then wash with rubbing alcohol (and remember, this also leaves an oil film). If I have to burnish the terminal, I'll wash it again with the rubbing alcohol, and follow up with a small squirt of isopropyl alcohol (no oil).

No isopropyl? Wet a cotton swab with high proof vodka.

Bonjour Franck,

Heureux de voir une question technique, cel&#65533; change des petites annonces et des scanners, Hi!!

Je vais poster des infos d&#65533;taill&#65533;es, le temps de les retrouver, j'en ai des classeurs pleins ...)

Dans un premier temps, de m&#65533;moire :

- l'EL509 et l'EL519 ne sont pas des lampes d'&#65533;mission et ont de cet fait quelques inconv&#65533;nients en HF (produits d'intermodulation), mais elles ETAIENT courantes, solides et peu cher (ce n'est plus vrai, hi).

- remplacer des 6146 encadre d&#65533;j&#65533; la modif :

- place disponible (519 plus haute et plus large)
- tensions disponibles (chauffage, polar grilles et haute tension)
- circuits d'accord disponibles

- la classe utilis&#65533;e pour la SSB est plut&#65533;t AB1/AB2 que B. Il y a donc une polar G1 pour que le courant de repos soit d'environ 20 &#65533; 30 mA par tubes.

De m&#65533;moire :

- il faut environ -9V sur G1 pour avoir ce courant de repos
- le chauffage filament est de 6.3V / 2A
- la HT peut aller jusqu'&#65533; 2000 V !!!, mais il est raisonnable de ne pas d&#65533;passer 1200V et de ventiler les tubes.
- l'intensit&#65533; plaque peut aller jusqu'&#65533; 0.5A si le circuit plaque est bien r&#65533;alis&#65533;.

Tout ceci est TROP pour remplacer une 6146. (600/800V Plaque, Ia < 150 mA ?)

mais qui peut le plus peut &#65533;ventuellement le moins ? Vous pourriez aussi trouver des lampes un peu moins QRO et plus petites en dimension, genre EL 502 / EL 504

PRECISEZ-MOI :

- Si vous avez de la place ou si c'est dans un transceiver, les tensions disponibles sur les 6146, les limites du transfo d'alim (intensit&#65533; chauffage et HT), si vous pouvez refaire les bobines du PA, le montage grilles &#65533; la masse ou &#65533;cran aliment&#65533;?

- si c'est pour modifier un ampli CB, c'est plus simple, mais part les lampes, le reste ne vaut pas grand chose !! Divisez toutes les caract ristiques par 5 (genre ZETAGI, transfo+diodes+chimiques+CV+commutateurs+support de la lampe n'utiliser .. qu'en CB, hi !!)

A plus tard,

Francis
F6AWN

From: long.22@osu.edu
Message-ID: <3709fb40.1543577@nntp.service.ohio-state.edu>
Source record: 71489

The Version 6.0 ROM for the FT-1000 altered the STATUS UPDATE command to provide the abilty to "read only selected parameters on the serial line".

However the sheet which came with my ROM did not include the details on the new commands. A query to Yaesu has so far not produced an answer.

Does anyone have this info?

Ed Noll, W3NQN of Anapolis, MD., has published articles on passive filters in ham radio, the ARRL Handbook, and EE magazines. He used to sell 88mhy toroids for some of these designs. I built his 200 hertz BW filter for CW, and I love it. Look him up in the callbook, if he doesn't see this and chime in.

It is a great old 'scope and WELL worth the money UNLESS it needs fixing! The tube lineup is quite extensive (expensive, too!). If you buy this fine instrument, you may want to find a junker 545 (for parts) at a hamfest. Getting a manual might take some searching. I do not know about parts compatibility, but I have a TEK 541 'scope with manual (about the same age --35+) with bad HV and "good all else" that you can HAVE for the freight (not a really great deal, BTW).

As for the testing, you plug it in, turn it on, let it warm up, and adjust Intensity, Focus, and Astigmatism controls for a nice pair of traces. Play with the Vertical and Horizontal position controls, then make a connection between each of the vertical channels (one at a time) to the CAL output connector near the bottom of the panel. You should get a decent square wave trace, after which you can try the Time Base (H) and Vertical scale controls. If all this works OK, reach for your wallet! If it craps out later, you may need to junk it, tho... I'd be hard pressed to resist taking it home, if I hadn't bought a clean 475!

Hello--

The Tek 54x scopes represent some of the finest pieces of test equipment ever manufactured. The plug-in design concept allowed Tek and a few other manufacturers considerable flexibility in designing accessory plug-ins doing everything from strain-gauge signal amplification to spectrum analysis.

The type CA plug-in was a wideband dual-channel vertical amplifier-- one of the more common and useful types. If ths scope doesn't include one, plan on spending from $5.00 to $50.00 for one, depending on where you buy it and its condition.

However, these scopes consume considerable power, are (as you pointed out) bulky and heavy, and they're well past the point where factory service and support were available.

You can still locate small-signal replacement tubes, and CRTs are also available. The real showstoppers are: range switches, power transformers electrolytic capacitors and and high-voltage transformers. That said, you can locate replacements from salvaged scopes and a few surplus dealers.

Older heavily-used CRTs exhibit 'double peaking", a condition that denotes a tube getting near its end of useful service. Check by examining the CRT's brightness as you increase the intensity-control setting-- the spot's intensity should reach a peak. If the spot brightens, dims and brightens again, you'll probably need a new CRT at some time in the future.

Makes sure that the scope's cooling fan turns freely-- lost cooling air killed a lot of these scopes.

For more info, get a copy of Stan Griffith's book "Oscilloscopes Selecting and Restoring A Classic"-- Stan worked at Tek and his book outlines differences among models and offers servie and restoration tips.

Stan's address:
Stan Griffiths, W7NI
18955 S.W. Blanton
Aloha, OR 97007

Stan's book lists several sources for components and manuals.

You should also purchase manuals-- one for the scope, and one for the plug-in. The manuals are worth buying solely as examples of good tech writing!

73,
Brad AA1IP

3813. 15m -> 40m QRP transvertor (suggestions?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-06 00:00:00 UTC
From: stickler@sirius.infospring.com
Message-ID: <7ed7i6$4lg$1@sirius.infospring.com>
Source record: 71498

Hey folks,

I have a very nice portable 15m QRP transceiver (cf. CQ magazine, Sept. 90). The rig's basic specs are: 3W CW, single conversion superhet, RIT, QSK, 1.4 w/0.4 KHz filter, 21.000-21.120 MHz.

I have toyed with the idea of a transvertor for some time to get the rig also onto 40 meters (rather than build a completely separate 40m transceiver, as the reciever in the 15m rig is so great).

I've come across a number of reciever convertor circuits, and some VHF/UHF transvertor projects, but nothing on HF transvertors. And all the transvertors I've seen are frequency multipliers, rather than dividers. Japan Radio used to have a mobile transvertor box for VHF->HF, so I know that it is at least feasible to do.

The present rig has 3W output, but I'd be happy with only a watt (or even less) on 40m. Likewise, anything around 50KHz or better tuning range would be fine (e.g. 7.0-7.050MHz). I seem to recall that the same capacitor provides less tuning range on lower frequencies -- so I expect that I won't get 120KHz of tuning range at 7MHz.

Does anyone have any pointers to circuits, articles, books, kits, etc. that might do the trick?

I'd prefer for the transvertor to be separate from the 15m rig, but I'm also not completely averse to hacking into the circuit board if that simplifies the job.

Any and all help will be greatly appreciated.

Thanks,

Patrick

KC4YYY, OH2LUV

For sale:

Headphones with boom microphone.
Jensen Model JMP-41
Headset Response is 20 Hz - 20 kHz
6' Cord with mini stereo plug.
Microphone is Low-Z Condenser type with 2.2 k-ohm impedance.
Response 30 Hz - 16 kHz

Durable and comfortable design with padded ear-pieces, ideal for
communications applications.

Brand new in box. White color.
Great for mobile HF or VHF operating. Think SAFETY!
Also great for extended rag-chews, contesting etc.
No PTT, but has standard connectors - 1/8" mini-style.
Will also work well with computers. Normally $29.95
New in box $20.00 plus shipping

Don't use WD-40 on anything that is high impedance. It conducts. I once sprayed it in the guts of a marine SSB transceiver and it killed the unit. I had to bake it for days in low-temp oven before it worked again.

.

Hello, I'm trying to build a simple direct sequence spread spectrum
receiver and am wondering how to go about the carrier tracking.
Let me give an overview of my approach:

```
IF1 IF2 ___ I _____
input---(mixer)-----(mixer)-----|ADC|------| DSP |
| | |___|------|_____|
f1 DDS Q |
\_____________________|
```

I've implemeted the code tracking in the DSP without trouble but I'm
curious as to how to control the DDS. My thinking is that by taking
atan2(Q/I) I can find the phase offset of the BPSK constellation and
adjust the phase of the DDS to move the constellation back to the
I-axis, assuming no drift of the DDS. But what about when there is
a Doppler shift present or even a changing Doppler shift (i.e. a
drift in the DDS)? I'm not sure how to handle that.

Any suggestions?
Thanks.

Most switch contacts are self cleaning if they switch enough current - the arc cleans them. However, sometimes when used in a very low current application they do get oxidized. I've had good luck by removing the switch from the circuit and putting it across a CURRENT LIMITED supply set at about an amp. Exercise the switch a few times - you'd be supprised how well it works.

3824. Re: Homebrewing power transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-06 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <370A90A6.8BC82DAF@teleport.com>
Source record: 71509

I've made a total of one transformer, and it wasn't difficult. I started with an old TV transformer and stripped off all the windings except the primary. (It was the inner winding, which I think is common.) What I needed was some high-current, low-voltage windings, so I didn't have a large number of turns to deal with. I did have to disassemble the core, but it wasn't much of a job. If you can get a transformer of the right size that already has a primary winding, it can save you quite a bit of time and trouble. I'd guess that a lot of surplus stores would have transformers of various sizes originally used for the large 5 volt supplies which were common not that long ago.

Thanks for reading this message. I am looking for information
from someone who has bought something on the news group
from an individual living in Canada. What are the import duties
or tariffs if any imposed by the US customs? I sure would hate to
buy this radio and find out that there is a 50% or more tariff on the thing!
I have not found a clear answer on the 'net.

Thanks,
Randy KB8ASO Milan, IN.

I am thinking of converting a Sears RoadTalker 40 SSB radio
to 10 meters. It is model # 663.38100050. Is this a Uniden
(Cobra) with a Sears name on it? If so, what is the Cobra
model # for it? If not who made it and what is its equiv.
model #?
Thank you,
Randy KB8ASO Milan, IN.

A lot of government agencies have web sites with all sorts of
information. Have you tried finding a web site for the U.S. Customs
Service?

Once upon a time I converted an SSB CB to 10 meters. After it was all done I think it was not worth while. Although it worked fine it took a lot of time and I had to buy the schematics and some crystals. Then it was worth less after I finished. I wished I had just sold it and bought an HTX-100 for $100 or so.

>ceci en vue de remplacer �ventuellement des 6146, avec un peu plus de puissance
>en sortie.

Ce genre de caract�ristiques n'est g�n�ralement pas publi� par les constructeurs pour les tubes de d�flection lignes comme celui-ci. Il existe des exceptions, mais je n'en ai pas rencontr�es pour ce tube-ci.

Je me permettrais pourtant quelques remarques. La EL519 est sensiblement plus volumineuse que la 6146. La EL519 n'aura pas toujours assez de place dans un appareil pr�vu pour une 6146. Il faudra aussi changer le support, la EL519 a une base magnoval contre une base octal dans le cas de la 6146. Quant au suppl�ment de puissance possible, je pense qui sera minime si on tient � rester dans le cadre des limites permises. � mon avis, une 6146B � la place d'une 6146 serait un choix plus judicieux, car il s'agit d'une version renforc�e du m�me tube, donc pas de support � changer, m�me encombrement. En tout cas, il faudra aussi v�rifier si l'alimentation sera capable de d�livrer le suppl�ment de puissance envisag�.

I bought a music synthesizer last year for $300 USD, I think I paid $15 shipping for 10# and U.S. Customs charged a $30 tarif and there was a $25 fee from a broker or someone like that. I wouldn't bother doing it again unless its really a rare item.

I think you'll find that items for PERSONAL use do NOT require a broker.
UPS, however, assumes that EVERYTHING is commercial, so they feed things
thru a broker. For 30 bucks or so. Use the post office. Check with FEDEX, as
they may be more friendly, but at higher transport rates. There is a publication
put out
by U.S. Customs, outlining the rules. Be careful in following the rules.
Also be conscious that things like scanners that can receive cellular frequencies
can
be considered to be contraband, under U.S. law. /mark

I have at least 20 ea. 22 volt 2.4 amp transformers in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 or 10/$30 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "53" with "snow" to make "snowhill" or call 334-347-5281 day/eve/wknd.

I have made a couple from old TV transformers. These were low voltage(50-60) units for audio amp power supplies. I cut a piece of wood the same size as the core, wrapped it in Teflon and then hand wound the secodary. The primary was still intact. I have a friend that used to do something similar but he did something much more high tech. He used a BBQ rotisery and a mechanical turns counter

Merci Francis pour ta rï¿½ponse,

C'est pour remplacer les 6146 d'un transceiver FT250 en restant dans la
lï¿½galitï¿½ cotï¿½ puissance. J'ai 4 EL519 neuves, les EL502/504 que j'ai sont
usagï¿½es.

Pour la taille ï¿½a tiendra en abaissant lï¿½gï¿½rement les supports, j'en ai
rï¿½cupï¿½rï¿½
plusieurs sur des tï¿½lï¿½ couleurs.

L'alimentation est de construction personnelle, je suis donc maï¿½tre des
tensions.
Il faudra simplement que je ne fasse pas amorcer le CV du PA, donc sans doute
pas plus que 800 ï¿½ 1000 V plaque. En courant je peut fournir 500 mA en crï¿½te,
soit 250 mA par tube.

This may be one case where homebrew is NOT the answer, especially
if you have to ask for help. If I made a suggestion, and you crashed,
I'd have a hard time living with myself.

In the USA, I think it's even illegal to use non-type accepted
flight-related electronics, and probably for good reason.

Randy:

If you live in the US and are purchasing something in Canada, only US customs may impose duties on your purchase. If the product is made in the US or if it's value us less than $50US, you will have not problems and to my knowledge, no duties will be charged. If it is not either of the above, they will asses a tax based on what it is (ie 5% or the such). You should check with them concerning this. I'm not sure on this, but there may be brokerage fees charged by the shipper to move it across the border.

Hello,
For experimental, non certified aircraft, you can use anything you
want for 'avionics'. So a homebrew radar altimeter is not "illegal".
After all, you can homebrew the entire airplane (and engine, too, if you
want). Incidentally, homebuilt airplanes are now the largest source of
lightplanes in the U.S; eclipsing all of the manufacturers of certified
planes.
My question would be, why have a radar altimeter in a non-IFR,
VFR-only ultralight? Your eyeballs and/or a regular pressure altimeter
are easier to use, and tell you everything you want to know.

73,
Don, W6JL

Norm OM,
Have you considered the 'TICK' keyer chip? Entire keyer fits on a one inch square pcb, and took me about 10 minutes to solder up all the parts (SMT). I use it for CW mobile; it is an excellent keyer, programmable from the key, and runs off a 3V disc battery. I've been using mine every day for the past 8 months or so. It is glued to the under side of my Bencher paddle.

73,
Don, W6JL

Dave, check your swr. The 706 starts cutting back in power output as the swr increases. I am sure you know that,but the 706 is specially sensitive to any swr.Even a small amout of swr will cut back the power output considerably.
P.S I love my IC-706mk2....

From: vk3em@hotmail.COM
Message-ID: <19990408030219.63741.qmail@hotmail.com>
Source record: 71442

G'day,

Removing SMT Diodes isn't all that difficult. In my
opinion, the safest way to do this is to use two soldering
irons with fine point tips to heat both ends of the diode
at once. You might find it easier to add little blobs of
solder resin before you try and remove the diode. The
presence of the resin seems to help the transfer of heat
from the iron tip to the joint. You dont need to move the
irons too much before the diode will come off the pads.
Dont flick the irons, or you will lose the diode. Carefully
wick up the excess solder on the pad with some fine SODER wick,
and clean the surrounding area of excess flux with
,1,1-trichloroethane or other suitable flux remover.

If it you do it correctly, you be left with a good diode
that can be used again and a pair of pads that are still
intact.

Crushing a SMT diode to remove it is to be ignorant of what you
may want to do with it in the future and/or how difficult it
might be to get a replacement should you need one.

Luke

Really? I stand corrected.

but...

For six years, I worked in avionics maintenance in the USAF during the late 70's. Part of the equipment I worked on was a radar altimeter used to provide focus distance for an airborne reconnaisance camera. I can tell you from experience, that there are many conditions in which a radar altimeter can give false readings during normal operation- many. I would NEVER rely on one to give me my ground-referenced altitude, or to protect from crashes, except as a last resort backup to a barometric-based primary warning system.

As a pure learning exercise, or for entertainment purposes, such a homebrew project has real attractiveness, however.

73, and good luck!

In article <370c15f2.3538065@netnews.worldnet.att.net>, Dave Hinerman
<hinermad@woodnet.att.net> writes
Back to the question the man asked.

From what I recall, radio altimeters don't use the pulse return time to measure the height. They either phase or frequency modulate the pulse and measure the phase or frequency difference between transmit and receive. This allows them to measure small differences inside the pulse rather than just looking for the pulse leading edge. The only details I can find are in an old (1946) radio and radar handbook which shows the TX/RX antennas on opposite wing tips, probably to get maximum separation between the TX/RX systems if they are sending and receiving simultaneously.

That's about all I know about them I'm afraid. Although, I must admit, from the perspective of being an ultra light and glider pilot, I would rather have "real" instruments as I've been scared too many times with ones that are flaky or when they have failed on me. Call me a wimp but a nice pressure altimeter, even a surplus one (My last ultra light had a WWII surplus one that I found in an antique shop for 6 ukp which just needed zeroing) is the best bet. Although I would still love to try and get a radio one working on top of that.

Cheers

Robin

Completely agree. In fact the RAF only fitted them to V Bombers and the
like in the fifties because they found that the under wing pressure wave
distorted the pressure altimeter close to the ground.

Also I recall having a couple of hours in a TriStar simulator about 4
years ago where the radio altimeter only came alive below about 1500 ft
or something similar. It's main purpose was to give very accurate
readings close to the ground, especially on approach. It wasn't used
under any other scenarios.

I picked up some homebrewed used test gear at the Arizona State Surplus Property dept. I have here some sort of resistance bridge/substitution box. It has among other parts two very nice Helipot precision 10-turn pots (testing within half a percent of marked value, 1K & 10K), and the drives for same. Pretty good for $3, huh?

I am having trouble removing them from the steel box they are mounted in. I can't get a wrench in to grab the nuts, or figure how to release the mounting clips. Help!

P.S. this thing also had an old Eveready No. 763 22.5V battery. Very cute brightly colored cardboard box with plastic thumbnuts. Any clue what these were used for?

Any audio tone generator circuit can be used as long as it is a very
clean sine wave. When a pure sine wave is fed into a ssb audio
circuit, it will generate the equivilent of a cw signal.. You might
have to tune off a little with the RIT control so that you are
receiving and transmitting 'on the same frequency'.

I do some side work at an Auto Electrical shop. Large alternators are easy to
come by... New model alternators are very clean.
The transdormers are 230 V - 12 V in reverse (3 of them in "Delta"
configuration) then a bridge rectifier for each, then put the output from the
bridges in series for around 900VDC. (1968 ARRL Mobile manual)

When lifting diodes to enable various features in handheld radios, I found it useful to stand the diode on end and leave the lower end soldered to the board. (When this happens unintenionally as the board is manufactured it is called "tombstoning.") That way the original diode is available if I have to un-modify the radio to trade or sell it. I even don't have to try to see the markings to tell which way it goes in - I already know.

Also, you can buy or make notched soldering iron tips that fit over surface-mount components and heat both leads (on a 2-lead part) simultaneously. To make one, take a wide chisel tip and file a rectangular notch in the middle wide enough to clear the part and deep enough that it doesn't touch the part itself.

You bet they are. I wish the makers of today's equipment could produce
manuals that are even half as good.

>The source of manuals for older Tek instruments is Deane Kidd, phone
>503-625-7363. He also has some replacement parts.
>
>Roy Lewallen, W7EL

Deane is really *the* expert on the 453A (great scope, I prefer it to a 465A).
I've restored two of them with his aid. I believe he bought the entire Tek parts
inventory for them when Tek quit supporting them. He has a lot of inventory
for other old Tek scopes too, but some parts for the tube type scopes are
unobtainium.

In many cases you can substitute something else, but in some cases you
can't. The only option is to get a junker for parts. When my 545B gave up
the ghost, I gave it to another ham to use as spare parts for his. Having
two or three carcasses on hand is very useful for keeping a very old scope
going. Switches and transformers are the sticking points. You can't get
replacement parts, or even reasonable substitutes, you have to salvage.

I wouldn't pay much for a 545. It is a huge old shop heater, and the sync
circuits aren't the best. For a few bucks more, you can find a 453A or
465 (the sync circuits in the 453A are the best). Those are better than a
mid-price brand new scope. You'd have to pay more than five times as
much to get a new scope that beats their capabilities. (I know, I have a
2465A too, and it cost me over five times as much as a 453A, but it is
only maybe twice as good as a 453A, and the improvements are probably
in areas that won't matter to you for servicing most amateur gear.)

Hi there.
If you get any help on this Impedance question ,could you
pass it on to me.I would really appreciate it , as I would find
it pretty useful.
I tried calculating the impedance by applying a sine wave voltage
(10mV) to the point I wanted to measure,and then measuring the current.
If you take into account the phase differences between voltage and current
you can calculate the impedance.It worked for simple R-C circuits.
I tried it into the base of a transistor with C-E short(measure transistor
input impedance) ,and it "seemed" to work(the resulting impedance
was not totally unbelievable ;)) ,but have no idea if it was even vaguely
accurate!.
I am going to try find a transistor model that I have Input and Output
S or Y parameters for,and see if they match what I measure.
Cheers
Rob

3874. EIMAC Cavity amp for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-08 00:00:00 UTC
From: w3atv@aol.com
Message-ID: <19990408105018.27672.00000032@ng-fq1.aol.com>
Source record: 71458

For sale- Eimac cavity amp for UHFmodel CV-400. Set up for 450mhz but can be adjusted for 400-500mhz. Uses 3cx400 tube. Solid built and conservatively rated at 300watts continuous service for FM use but could do 600watts SSB & CW. The entire cavity is there but you would need to build an enclosure, control circuits and power supplies. I have a tube with it but the condition is unknown and should probably only be used for testing the amp because it is old. I have pics available by email.
Tnx,
W3ATV

3875. FS or TRADE: RS HTX-202 HT New in Box!!

Newsgroup: rec.radio.amateur.homebrew

Source record: 71459

I have a brand new HTX-202 2 meter HT that I would like to sell or trade for a 25-30amp regulated power supply. I purchased two of these units when Radio Shack was closing them out. I thought my step son would take an interest but since he has not, I only need the one I've been using. The second unit has been in the original box and I only had it out to make sure it worked and that all accessories were there. It is missing the original manual, but I will download manual from RS website and include.

I will only consider a trade for a new or recently purchased 20-25 amp supply or a 30-35 amp supply in good or better condition. I will also sell the rig outright for $125 plus shipping.

If interested email me! Tnx

Yeah, I'd like to hear how to do it also, but the general idea--I use
Microcap and some other spice engine for analysis.

: There's an interesting idea... would you wind them yourself?

Hey, I did something like that. I used 3 'surplus' 400cps 12v
transformers. I went into the alternator and came out with the
three phase ac -- ahead of the alternator's rectifiers.
Using heavy gauge wire, I connected the the 3-phase to a socket
on the outside of the Jeep. I mounted the 3 transformers plus
rectifiers in an ol' 20mm ammo box with a cable and plug to
run to the socket on the Jeep. I mounted a regular 110v house
socket in the side of the ammo box for the (almost) 110v DC.

Of course the alternator output freq varies with engine
RPM -- but, it seems to perk along 'ok' at an elevated idle.

Use it to run "universal motor" tools out in the boondocks: drill,
electric chain saw, etc.

It's just a 3 transistor differential amplifier. It's similar, but not identical, to the CA3028 that was seen a lot in receivers years ago. The biasing, and probably the pinout, is different, but that might give you an idea of it's useage.

1 input (this is the bare base of the bottom transistor)
2 ground (emitter of bottom transistor)
3 ground (ground return for some biasing network)
4 input return (biasing for the base of the bottom transistor)
5 AGC (base of one of the differential transistors, via resistor; base is biased internally)
6 output (open collector of a transistor in differential pair)
7 substrate (should be grounded)
8 bypass (base of other differential transistor, base is biased internally)
9 Vcc (open collector of other transistor in diff pair; but resistor for biasing network feeds off here)
10 bypass (direct connection to the base of the transistor mentioned in pin 5)

That's probably less than you need to use the thing, but hopefully it's a start. I don't have a way of scanning the data sheet. I've taken this out of my Motorola databook from about 1978; it wasn't in the one I have from about a decade ago.

In effect, you have a differential amplifier where you can bias the bottom transistor in any way you want, but the differential pair is pre-biased, at the same point, and one of the bases (pin 5) isolated from the bias network via a resistor.

Dear all,

Please subscribe and discuss at Icom IC-2800 community!!

http://www.onelist.com/searchlist.cgi?searchval=icom-ic2800&language=0&maturity=0

New top-of-the-line dual bander adds video excitement to audio excellence. Advanced features and a unique, 3" (diagonal) TFT color LCD display await you. View GPS and APRSTM maps, catch SSTV or broadcast TV,... even watch digital camera and VHS images. Experiment! The high visibility screen accepts NTSC video input (PAL in the European model) via a simple connection port that accepts most standard camera plugs. A 6-pin data port makes the '2800H 9600bps data ready. ICOM's popular independent band controls are here, making it easy to work V/U, U/V, or cross band repeat. Also get: CTCSS encode/decode, simple band scope, fast scanning, 232 memory channels, air band reception, and much more. The control head is totally separate from the main unit, with a connection cable and independent mounting brackets included as standard equipment. Explore SEEING as well as hearing more of today's amateur activity.

Best Regards,
Bo

Frequency-domain programs like the ARRL RF Designer are more suited to doing anything-vs-frequency analysis, but it can be done with SPICE. First, I recommend using the AC analysis. This automatically makes the source voltages and currents very small to insure a linear analysis. You can use a big sine wave source if you want, but the meaning of an impedance that changes over each cycle of the waveform is a bit fuzzy.

What I generally do is put a zero-volt voltage source in series at the point I want to measure, and use that to get the current. For example, if I'm interested in the impedance at node 10, I put a zero-volt source in series there (say, v0a). Then for a Probe output I add the trace v(10)/i(v0a). That will be the magnitude of the impedance. You can get phase, as I recall, but don't remember the nomenclature for sure. I think it would be vp(10)-ip(v0a). For real and imaginary (R and X) parts of the impedance, I think vr(10)/(i(v0a)*i(v0a)) will give you the R, and vi(10)/(i(v0a)*i(v0a)) the X. Try it on a simple series RL or RC circuit to make sure it's correct.

I recall in the dim past doing the multiplying or dividing directly by using a dependent source whose value was determined by the product of two others. But I don't recall if I did this with PSpice or some other variety, and don't have time to research it now. You might look into this possibility.

I don't know if it's still available, but I have a brief but excellent book on SPICE modeling. It's _Spice: A Guide to Circuit Simulation & Analysis Using PSpice_ by Paul W. Tuinenga. It was packaged with the PSPice demo back in the DOS days, but available separately from the publisher (Prentice Hall, ISBN 0-12-834607-0). The author is with MicroSim, the company that makes PSpice. I highly recommend it or its successor.

3886. Re: altimeter RADAR

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-08 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be823d$920d1760$4c3e63c3@default>
Source record: 71470

A 1944-5 radio altimeter used a few milliwatts (from a pair of push-pull acorn triodes) Tx power, about 1 GHz if I remember correctly, frequency modulated with a sinewaveform at 400 Hz. The Tx was a frequency modulated push-pull oscillator. Modulation was by using a small metal loudspeaker diaphragm as one plate of the tank tuning capacitor. With the cover off the case, the speaker could be heard humming away to itself.

Receiving and transmitting antennas were simple dipoles, one under each wing and screened by the fuselage.

The receiver simply mixed the the transmitted signal with the received signal to give a DC output proportional to height above ground. When the phase difference was zero so was the height, or very nearly so.

I'm contemplating setting up a Web page with an archive of Circad files (schematics and PCB layouts). You you think this would be useful? I've found several project files in the ARRL archive that are (or contain) Circad files.

If you're not familiar with it, Circad is a schematic capture and PC board layout package that runs on a personal computer. The commercial version is somewhat expensive (in the hundreds-of-dollars range, exact figure escapes me), but the publisher, Holophase, makes a hobbled demo version available for download for free. The only limitation I've encountered in the demo is that it won't output Gerber files (which are pretty much required for a commercial board fabricator to make your boards), and it won't translate certain other PCB software file formats. It -does- allow you to save schematics and PCB layouts to disk, and it will let you plot them on any Windows-compatible graphics device such as a laser or inkjet printer. In fact, I've made a couple of PC boards already using a laser printer and toner transfer paper. Not quite up to commercial board standards, but good enough for most hobby work.

Anyway, would you like to see a selection of Circad project files? And, do you have any you'd like to share? Credit for sources would be included in the archive.

Dave

P.S. I'm not associated with Holophase, and don't stand to gain anything by promoting their products. D.

Don't crush the diodes. Use the proper tools and procedures to do the job correctly. Yes there are many ways to do one thing, some are risky, some are not. It really is no big deal to work on surface mount equipment, it just takes a little change of thinking and a good attitude towards the hobby in general. There are Elmers....and there are Elmer Fudds......

If you crush surface mount diodes:

1) Are you certain that the part is a diode? keeping old parts intact can help figure out what the critter really is. Surface mount parts often do not have much in the way of markings. Sometimes the only way to really tell what something is by the schematic or experience (if you have worked on many many smt things) Don't assume.

2) Do you know if putting pressure on the diode will damage the circuit board? Are you certain its just a single layer or multilevel board? Sometimes pressure on one side of a board and/or one area will cause a bowing of the board, especially if still in a chassis. This could cause a new problem in another area if you are not careful and if the board you are working on cant take the abuse....

3) Even if you crush the diodes with small diagonal pliers and thus not putting pressure on the board in any way.....are you following good ESD (Electro Static Discharge) protocol. ESD is real. Crushing diodes might be ok for a rush job, but are you in a rush? Wouldn't you rather wait and do a good job and be proud of that instead of ruining a rig in a quick second. There are also dangers with parts made with Beryllium Oxides..But I wont get into that in this situation...

4) Even with the diode crushed, the end caps of the diode will still be in place and have to be desoldered...why make things difficult?

5) Even if crushing a diode to quickly disable its function......it will look like garbage, and a possible future buyer or radio tech of the rig will cringe at the sight, and wonder what other things has this radio been thru?

For removal of these diodes, (now that I have offended the diode crunchers) here are suggestions:

Use solder wick and a tiny drop of flux on the wic. Use a good Weller or Hako grounded tip solder iron . Be certain you have a good clean tip and a ESD safe workbench. Also use a good magnifying viewer, the kind with a round lens and a round florescent light around the lens that bolts to a workbench will do.

Place the solder wick over one end of the diode, apply heat with flat side of iron tip. Solder should flow from crkt board/diode to the solder wick. Copper solder wick will take on solder and have a "tinned appearance. This removes some of the solder from the board, the solder is actually a conductor and a kind of "glue" for the part... Do this long enough to get most of the solder up. The part will not be free yet. Do same to other side of diode. Now, use a good pair of tweezers to grasp the center of the diode. Take the entire side of the tip of the iron and quickly try to hit both sides of the diodes "endcaps", Diode should pop off board, and your solder pads should still be good for installation of another diode, if you didn't heat the diode/crkt board too long.

For practice, pick up a few destroyed VCR's at a flea market or hamfest...a few bucks on a junker will get you some smd's to remove for practice and some fun spare parts...the tuner section of the VCR may have a cool rf downconverter/tuner in it that can be used for many things....

For a reference on soldering, find a older US Mil-Spec manual on soldering...smt technology has been around for a while in mil gear, it works, is more reliable, compact, vibration proof, easy to manufacture and when you really get into it simple to troubleshoot. Naturally there are some problems, especially with cheap companies skimping on wave soldering...but what is perfect?

For some good help if you are totally bewildered, don't forget about your local vo-tech school or technical school. They would probably be able to remove and install such a part.

3891. 220 Amp plans

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-08 00:00:00 UTC
From: tomk89@aol.com
Message-ID: <19990408185347.28880.00000315@ng-cg1.aol.com>
Source record: 71475

Can anyone point me in the direction of plans or schematics for a solid state 220Mhz SSB/CW amplifier? Looking for about 150 - 200 watts out for 15 in.

Thanks!

Tom Knee - KB2SSS
TOMK89@aol.com

3892. Need ICOM 706 MKII adjustments on the main board.

Hi Gang
Would anyone have any information on the Adjustments on the main
board for a 706 MKII? The owners manual is very sparse on this.
If you have any information you would like to share you may send it to me via
E-mail at D.R.Abshire@att.net

Anyway my 706MKII is only putting out about 65-70 watts PEP on HF and 20-30
on 6 meters. 2 meters seems to be OK. Oh by the way I did check this into a
dummyload.......

Our local guru has suggested the use of a DTMF chip and only selecting
one row or column. This has the benefit of providing a sine wave and
eight different tones. You could get clever with switches or Berg
jumpers to select the tone you want. He is looking into designing an
MCW generator to add CW practice to our local repeater.

Dave,

I've used CIRCAD before and would like to see a site as you describe. When I downloaded the "free" version of CIRCAD from their web page, it was an earlier version but was a "full" version that included gerber file output utilities?

3900. thanks [Re: MC1550 data?]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-09 00:00:00 UTC
From: Jussi Saksa <jussi.saksa@lmf.ericsson.se>
Message-ID: <370DA672.B9840951@lmf.ericsson.se>
Source record: 71385

Hello,

thanks to all of you who replied
to me, I now got the picture. The
MC1550G's were used in VHF hand radios
manufactured by Sonab, later Ericsson
Radio, as an IF amplifier for 10,7 MHz.

The batch I have were scrapped by the factory's
quality control, but I think they work nevertheless.

There were two MC1550G's connected
in series (DC supplies that is) so that each amp got half of
the supply voltage. This was done in order to
keep the IF amplifier's total power consumption low.

But it also meant that the ICs had to be sorted
before installation so that there was a 'matched pair',
i.e. the voltage drop over each amp was equal.
And these ICs I have were outside the allowed voltage range.

Needless to say, these VHF radios were quite expensive and
were replaced in early 80's by synthesized units.

regards,
Jussi Saksa

I don't know when this current version was issued (although Help:About
show version 4.06d, released 1/15/99). But it definitely doesn't
output Gerber files.

I'm not sure the 256nb is a good choice for repeater service,are you using them because of they are frequency aqile??? If so,keep in mind the logistics of changing duplexer/circulator frequency. Also the power output would need to be lowered to some degree because of duty cycle limitations.

From: stickler@sirius.infospring.com
Message-ID: <7el1r5$3dg$1@sirius.infospring.com>
Source record: 71391

Hey folks,

I have a 15m QRP transceiver (cf. CQ magazine, Sept 90) which uses
a 50pF variable tuning capacitor and has approx 120KHz tuning range
over the 15m band.

I just inherited a very nice 140pF variable capacitor (Hammarlund)
and am curious if swapping it for the existing 50pF cap would give
me a wider tuning range, possibly covering the whole 15m band.

If this would work (or if not) could someone please explain why?

Thanks,

Patrick

Keep in mind about possible interference with other repeaters/frequencies in use. As you increase your accessability to your own repeater you become a possible source of interference to others. I recommend you check with your area repeater coordinator once you have worked out the machine issues.

Is there any problem with Dejanews?????
The messages I am getting are too old.
What happened?

Gilson Puppin - PU5MPL

I noticed the same thing, this week. I sent an email to them
but I haven't gotten any response.

This does not apply to amateur radio equipment. There's NO duty on ham equipment. Otherwise for all other stuff there's Duty about 5-10% and taxes about 7-8%. Then if you use a broker it cost even more. If they think you claimed too low they can appraise it for you at a using some rediculous method. If they catch you tring to hide it in a car they can impound the car and charge you double duty and taxes to get your item back or it goes to auction. Remember to mark whatever you are sending clearly "AMATEUR RADIO EQUIPMENT" 73 Chris

3918. found 455kHz BFO ckt for AM SW RX!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-09 00:00:00 UTC
From: Mike & Coreen Smith <ve9aa@nbnet.nb.ca>
Message-ID: <370ED6C5.9D6B40A5@nbnet.nb.ca>
Source record: 71403
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.homebrew

Hi, Several weeks ago I was looking for a BFO cct/ckt for an AM SW rx.
Mark <mcaldera@ix.netcom.com> sent me a nice little cct which I
initially
didn't think worked, but it turned out I had a bad breadboard ---
(20yrs old+) and a low Q IF can.
New board, new can, cct works like a charm !

This cct (or 'ckt' if you prefer) will allow SSB/CW/DATA reception
on an AM receiver that uses a 455kHz I.F. (most have that frq i.f.).

If anyone wants the .bmp file for this VERY simple cct, just let me
know.
I have it saved in b/w format, which makes it quite small (44kB in size)

Thanks again to all for their suggestions !

Looking for :
Motorola (UHF):
VISAR (UHF/ VHF) (Can have DTMF or not)
MT 2000 (Can have DTMF or not)
HT 1000
GM 300
SPECTRA (DASH MOUNT)

All radios must be in working condition and contain everything need for proper operation (Bat, Mic, Power Cables, Ant etc...). Also Must be to work within the 470 - 512 Mhz.

Contact me with an asking price if you have any of the above that you are willing to let go of.

Let me know
Kevin, N3JMD

It is my understanding that there is an exemption of some type for amateur radio equipment purchased for personal use (not resale). It's been a while and I don't remember the details but I purchased a PTC-II from SCS in Germany for $900 plus and was not accessed any import duties on it.

3921. WTB:UHF [70cm] mobile motorola duplexer, please ;-)

the below listed repeater needs a 70cm motorola mobile duplexer.
it only runs 25 watts output on 70cm so it's a good match.
quite awhile ago, someone was selling them for $50 but no contact.
anyone out there care to help out the machine.
thanks for your time.

Source record: 71329

I have built linears calling for 3-500's but used 4-400's with the extra grid grounded. Works great! Most any amp with 3-500's can use the 4-400's if you ground the screen grid with the others. Being a broadcaster, I have access to 4-400's, so I use them.

4-1000's also work in place of 3-1000's if you ground the extra grid. That's my next project, since I have several of them.

3931. Re: RTTY decoder circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-10 00:00:00 UTC
From: Harry Lythall <no.one@no.where>
Message-ID: <7eogti$t13$1@zingo.tninet.se>
Source record: 71332

Hi John,

A few years ago I was trying to tell a friend that I did not want a teleprinter but I lied. I made a ridiculous offer and it was accepted. I ended up with a Creed 7E/RP and nothing to use it. I decided to design my own TU so I developed a TU using the NE565 PLL decoder. You can find it on my homepage at http://hem2.passagen.se/sm0vpo but I would be interested in your circuit. My E-mail address is sm0vpo@geocities.com My TU is also equipped to drive an RS232 interface and I used to have a BASIC program that converted RTTY (Baudot) to ASCII code. It is quite easy to do but I no-longer have the program.

The basic problem with the NE567 solution is that the tones must be on the right frequencies (1275 & 1445Hz) but a PLL circuit using the NE565 tracks the tones and gives a square-wave if the tones are within the AF band. QRM is a problem (like on the HF bands), but for VHF it is ideal.

If you listen to RTTY on AM you will hear nothing. FSK appears as a continuous carrier that occasionally (well, quite often actually) wobbles in frequency but the amplitude should not change. Adding a BFO will resolve it in exactly the same way as a CW or an SSB station.

When I started on RTTY I know nothing. I never even heard of the 88mH torroidal chokes and the like. That is why I used a PLL system. The encoder was a simple multivibrator!

David Cunningham wrote in message <7eoa3ranj1@plutonium.btinternet.com>...

3934. Elecraft K2 - Easy to Build

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-10 00:00:00 UTC
From: "Eric Swartz - Elecraft, WA6HHQ" <erics@elecraft.com>
Message-ID: <370FF1F5.B9A7FA10@elecraft.com>
Source record: 71335

I've noticed several messages here asking how difficult the K2 is to build and how much experience is required.

We've designed the K2 so that anyone with good soldering skills can build it. If you have build any other kit, such as the Wilderness NC40, Sierra, Ten-Tec kits etc, you will have no problems building the K2. It is just as easy (sometimes easier) to build - it just has more parts to stuff in the PCB. Since we only use through hole parts it doesn't require tweezers and a microscope to build.

We eliminated the use of wiring harnesses with our 'wireless' design and we also built in key test equipment (volt-meter, freq-meter etc.) so that you don't need a room of equipment to align it. Actually only a digital VOM is suggested.

For more info, check out http://www.elecraft.com . We have a section dedicated to user comments and a complete downloadable manual.

We'll also be at Dayton in booth #192 if you want to see it first hand.

Please feel free to email us if you have any questions.

73, Eric WA6HHQ

I just checked, and I see the same thing. I know I posted here today, and it's there if I do a search for my email address, but it's not there if I look for it by browsing the newsgroup.

This is reminds me of a year and a half or so ago, when a newsgroup that I'd checking at dejanews suddenly was no longer there. Dejanews still collected the messages, and they'd show up if you did a search, but they de-listed the newsgroup because there was too little traffic.

I did note earlier in the week that dejanews has changed yet again their site. Now, when you browse a newsgroup, you get a list of threads, and you have to click them on to see the messages, whereas before you would just see a list of messages more or less organized by date.

I suspect that there is some connection between the new format (I noticed it just a few days ago and assume it is a recent change) and the messages not appearing. I would guess that they haven't got the bugs out, unless I'm wrong in assuming that the change took place just a few days ago.

Dejanews keeps changing itself. A while back they eliminated the ability to see threads if you did a search for a keyword. I didn't find it too useful a change. This new change may be useful to those who use dejanews for everything, but I find it not useful to me when I search for missing messages and don't want to wade through various levels to check. It would be nice if when they changed things, they'd keep the old too.

I would have to look up the specs in my telephone engineering handbook,
but I have been told that an individual row or column indeed produces an
acceptable sine wave. It has to be better than the stuff a 555 or 556
produces. I guess that it would depend on the part used too, wouldn't
it?

--

I have the book. The board set is available from FAR circuits for
around $120 (US) as of September '98. There is a bit of mechanical
fabrication in the tuning hardware that is mostly left to the ingenuity
of the builder but to my novice homebrewer eyes, it looks ok.

3938. Impulse-domain radio... comments?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-10 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>

Some interesting work is apparently being done in the area of single-cycle pulse-based communication in extremely wide bandwidths, on the order of 1-2 GHz. See http://www.time-domain.com, particularly the "Impulse Radio Overview" paper referenced at http://www.time-domain.com/technology.html. I hadn't heard about this stuff before it showed up as a news item on Slashdot. Has anyone else looked into it?

While the transmission technique (pulse-position modulation) is simple to understand, there doesn't seem to be any information on the site with regard to how to lock a receiver onto a low-power, low-duty-cycle pulse train in such a wide bandwidth. Anyone have any thoughts on how a "time-domain discriminator" might work?

This sounds like something out of the April issue of QST, but evidently it's 100% on the level, made practical by the advent of modern high-stability timebases at economical prices. It actually may not be much of an exaggeration to suggest that this family of techniques represents the End of Radio As We Know It.

> If this would work (or if not) could someone please explain why?

This would probably work, with a few caveat's.

1. The tuning may be much more sensitive, so you may need to use a 3:1 or 6:1 reduction to make the tuning feel comfortable.

2. The min capacitance may be higher for the 140pF unit, so you may need to retune things to get the offsets right in the band.

3. You may have some reduced power at the band edges, depending how sharp the filters are. This will probably not be a big deal.

4. With higher capacitance the 140pF unit may have less stability, and the rig may be more prone to drift. (But on the other hand it depends on what you are replacing. The hammarlund stuff is pretty well built).

I'd give it a try.

I have a number of Tektronix 530-540 series scopes (wish I had less), and notice they are starting to malfunction. At a minimum, I would take off the side and bottom covers, set it right side up, and turn it on, carefully watching the side opposite from the plug-in. There's a time delay device, and wait until it operates, which applies B+ . Be ready to turn it off quickly if there problems (sounds, smells, etc). You can then do a little preliminary trouble shooting and see where the problem area is, i.e. where is the smoke coming from. If it is underneath, you are ready to tip it over and check it fairly quickly. Have the work bench clean, so you can put it on it's side without damage. I reread your post, and notice you are going to check it at the store. Taking off the side covers is still a good idea, particularly if you plan to make a lowball offer if there are problems.

If no sounds or smells, and no trace, look at the little neon bulbs giving rough trace position. There is a good chance the trace is off the face. If the trace is a point, avoid a bright point (turn intensity down) to avoid burning the CRT, which makes the phospor black.

If you have a choice of a number of manuals, notice a serial number is listed on the front page. Pick a manual with a serial number equal to or a little higher than your scope serial number.

I think a bad CRT is the least of your problems, and would not worry much about it initially. When trouble shooting, checking power supply voltages at the test points is a good start.

Out of curiosity, is there any way to adjust the BFO
injection level? Seems like different receivers might
need this capability.

Years ago, I was able to hear SSB by tuning (very very carefully!)
one SW radio to about 455Khz above or below the other.
Both radios were analog-tuned -- this was before digital
except for one Panasonic model I would have sold a kidney for
back then.

In short, it worked, and if you didn't sneeze and the
temperature didn't change a tenth of a degree, it might
stay on frequency for a whole minute or two. :)

Thanks for offering to pass along the info. to those interested.

By the way, there was another modification that was popular back in the days when tubes ruled and the number of active components could still be counted on your fingers: regenerative feedback in the IF stages. At least in theory, a little positive feedback would sharpen the selectivity of the radio AND give you a fair bit more gain. Adjusting just the right amount of gain so it didn't start to oscillate, or take the Q of the circuit so high that it was too narrow for good speech, was purely trial-and-error.

Hey, wait -- maybe if you turn up the regeneration gain high enough, the IF would oscillate, and you wouldn't need that BFO circuit. ;)

Hi

I'm searching for a good CW tranceiver QRP kit for a group of novice licenced
hams that just received their licence.
The kit should have the following features:
* Simple
* Easy to build and come with good building instructions
* Should be usable on the 15m band
* Nice, not not required, if the tranceiver can be switched
to another band by replacing a plug-in module.
* Cheap! :)

Any hints, pointers, URLs?

Thanks
Hrafnkell

3954. RTTY decoder circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-10 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7eoa3ranj1@plutonium.btinternet.com>
Source record: 71425

I recently found a circuit for a simple RTTY tone decoder, based on the NE567 PLL, in a 1987 magazine. I am considering making the decoder, and wondered if I would be likely to find much RTTY activity on the short wavebands, and if RTTY is used much in amateur radio these days. I would also like to know how I could connect it to my computer (standard 5-volt logic output), and where I can find suitable software on the internet. Could anyone describe what RTTY signals sound like on an AM radio? If anyone on the newsgroup wants the cct, I can scan and email it.

Thanks, 73 de John.

3955. WTB: S-100 bus modem

Yup. I've even used it to tease the Star Roamer into receiving
SSB signals. Definitely a touchy arrangement, between having to
set the sensitivity control so that it oscillates enough to create
a good BFO yet doesn't either take the Q too high or produce so
much BFO output that it causes the AGC to kick in and kill senstivity
to the input signal. All the while keeping a hand on the bandspread
to compensate for driftiness.

Not the sort of thing one would want to do on a regular basis, but
it *can* be done.

I don't know about the circuit in question, but if it's built into a shielded box it should be easy to add a trimpot on the output to adjust the level into the receiver. It is a good idea, though I think it will be something that will not need constant adjustment.

It's interesting you should bring up the idea of regeneration in the IF. This just came up recently, in rec.radio.shortwave and rec.radio.amateur.homebrew with two separate threads on the Star Roamer receiver. It had such feedback in the IF; the control is labelled "sensitivity".

I've never had a receiver with such a circuit, but it's my understanding that when you put the IF into oscillation to act as a BFO, it stops being as selective as before. So you can receive SSB and CW, but the bandwidth isn't very good.

One of the cheap Hallicrafters tube receivers used such a scheme instead of a separate BFO.

More common than putting the IF into regeneration was the Q-multiplier. It was a stage, often seen as an external addition, that tapped onto the output of the mixer. It was a tuned circuit and an amplfier. Feedback was introduced, and thus the bandwidth of the coil was improved and thus the selectivity of the receiver improved. Depending on the Q-multiplier, it could also be put into oscillation to act as a BFO.

The problem with Q-multipliers and regeneration in the IF is that while it narrows the bandwidth it does little for the skirt selectivity.

In one of the first issues of QST that I received, May or June of 1971, there was a neat article about converting an All American Five for shortwave use. After adding an isolation transformer to protect the user from shock, the author added some regeneration to the IF to increase selectivity. He added an outboard BFO for CW and SSB. And of course he put a crystal controlled converter ahead of it to cover the shortwave

range. He even added a tuning eye indicator for signal strength. I believe he also added a switch to disable the AGC in the receiver, and probably added an RF gain control. It was a rather neat project, especially to someone who was eleven at the time and who had only a table radio with a shortwave band (and no BFO) to listen to shortwave.

By the way, if someone is adding a BFO to a receiver without one, disabling the AGC and adding an RF gain control would be useful. Though it's probably difficult unless you have the schematic for the receiver.

I'm trying to read the messages posted to this news group using my browser
(Netscape 4.08 pointing to dejanews.com), as I used to do.
The newest message I get is dated 6, april.
I can post a new message but I can't access it by the regular way, I mean,
ordering my browser to get the new messages.
I can read the message I posted, using the feature "author posting history".
Can anybody help me to solve this??
I wrote to Deja News but didn't get an answer until now.
Thank you.

Gilson Puppin - PU5MPL

Hello All,

This is Mike, KQ6MU.
A friend of mine, and I, are trying to build
a 2m repeater. We got a Motorola Micor VHF Hi
Base Station. It was tuned to 155 MHz. We need some
help on duplexing this, tunning it to the 2m band, and
other things that will be needed to "Mod" this to a
repeater. If anyone can give us info on this, we would
greatly appreciate that. Anything is welcome.
E-mail me with info please.
Thanks & 73,

Mike Green KQ6MU

I had a little shortwave receiver - I think it was a Hallicrafters - that had an "AM / CW" switch on it. (Which surprised me, since Dad's Zenith Trans-Oceanic lacked it.) I looked at the schematic to see if I could adapt what I assumed was a BFO to the Zenith.

Turned out it was nothing more than a piece of bell wire wrapped around the plate lead of the IF amplifier tube to make a small gimmick cap. The other end of the wire was attached (or maybe even wrapped - I don't recall exactly) to the grid lead of the same tube. The front panel switch, in the AM position, connected the wire to ground through a resistor, killing any feedback in the stage. In the CW position, the IF amp wouldn't quite oscillate, but it would ring nicely when there was a strong enough signal.

>
It's not a matter of whether it's better than something else, but whether
it's good enough for the task.

A pure single tone audio frequency fed into an SSB transmitter will put out a cw signal. More commonly, you'd see this years ago for transmitting teletype, because it was easier to have an audio oscillator switched between two frequencies and fed into an SSB rig than modifying the rig to do direct FSK.

But if the output of the audio oscillator is not clean enough, you won't have a single frequency out of the transmitter.

You would never consider a sauare wave for this application (remember the original poster wanted to send CW on an SSB transmitter by feeding in an audio tone), the 555 puts out a square wave, because the result will not be a single frequency.

Even a bad sinewave may not be good enough. I've seen comments over the years about oscillators for this sort of application, and people have discarded certain circuits becuase the oscillator does not put out a pure sinewave.

The touchtone encoders I've seen use a D/A converter to produce a sinewave. The early ones seemed to produce a stepped sine wave. I don't know whether recent devices have used improved techniques.

I'm not saying the idea won't work, just that it's something that needs to be examined before using the idea.

Probably a fairly simple low pass or band pass (since we are talking about a single frequency) filter would take care of the problem, since at least the output of the oscillator is relatively close to a sinewave.

If someone wanted to send MCW, feeding a tone into an AM or FM transmitter, probably this would not be a consideration.

Finally, to add to the original suggestion of using a touch tone encoder, I think the ability to generate a single tone varies with the device. The old Motorola MC14410 had two outputs, one for each of the tone groups, and you were supposed to sum them externally. Glancing through a TI book, one of their's had a pin that enabled single tone output (I didn't check to see what the output circuit was like). An EXAR book turned up one encoder that didn't have a clear way of selecting a single tone. So this too needs to be watched. I've never used one, so I don't know if ignoring one set of inputs disables that tone or simply puts out a default tone.

Source record: 71351

Instead of the 567 circuit, you might want to look for a program called Hamcom. It uses an op amp like a 741 and the program will do the decoading. There are also several other programs out that use the same interface. Not sure of the names, but there are some out that use the sound card also.
You usually use the lsb on a receiver to tune in the ham rtty and some of the comercial stuff is usually usb. Yu can really use either, but the program or decoder has to be set to the inverted mode to do it. A rtty signal is sent out as one frequency, then shifted to another about 170 hz away in the ham bands. The comercial stuff will be differant. Don't recall the frequencies or times, but the ARRL sends out bullitins on rtty at 60 WPM several times a day. This is a good place to hear wht you need to. After the Baudot portion is over, they switch to another mode, maybe two other modes. Most ham rtty is 60 wpm with some going to 100 wpm with a sshift of 170 hz.. The comercial stuff can be almost anything.

Look here for the Hamcom page.
http://www.accessone.com/~tmayhan/

There is a diagram in the softwear for the interface. and it is as simple as the 567 decoder and is powered by the voltages of the rs232 port also.

3968. LW/MW-loop antenna using telephone cable?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-11 00:00:00 UTC
From: la8ak@online.no
Message-ID: <37109215.406613572@news.online.no>
Source record: 71353
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

The PE1ABR VLF loop-antenna was described in Electron nr 2/99 and Radcom TT nr 4/98, it used a large loop of 25x10m square from coax cable, possibly RG-8/U or RG-6/U

The antenna was made to cover 200-600kHz, but works fine for 136-2000kHz

Wonder if it is possible to use screened telephone cable instead, take a 20-pair cable with support wire, and connect 2-pairs in parallell as center conductor, possibly use vaselin filled cable

Mean impedance for 1 pair is 120 ohm, but connecting 4 wires in parallell might lower the impedance, has somebody measured the impedance for similiar connection? It shouldn't be too difficult to measure, and I believe the vaselin shouldn't cause any attenuation on this frequency range.

a scanned figure of the antenna is available as 5kB gif file

I'm searching for a free news server in order to begin to access usenet
directly.
Could you suggest me some servers.
I'm in Brazil and my internet provider do not have this kind of service.
Thank you.

By the way, today I could get the messages without any problem.
Thank you all.

> simultaneously.

Sorry. Missed the original post.
Modern airborne radio altimeters operate in a 200 MHz band centered
at 4300 MHz.

The most common modulation type is FMCW. In this type of system the
transmitter is chirped i.e., the frequency is swept lineraly with
time. Therefore the frequency difference between what is transmitted
to the ground and what is being received from the ground reflection
is proportional to altitude. Pretty similar to what was done in
1946 is sounds...

Pulsed systems that measure the difference in time between when a
pulse is transmitted to the ground and received from the ground
are also common. The leading edge stuff gets important where
you want to find the altitude to the 'highest' point on the ground
instead of the average altitude of the ground... everything
past the leading edge gets corrupted by multipath.

Direct Sequence Spread Spectrum (DSSS) techniques are used where
jamming and low detectablity by bad guys are important.

Howdy to all.

First, I have no ticket yet (damned code) but I am on my way. We have all been there at some point in our lives. I'm just throwing out design ideas with no foundation to base them on.

OK, PC motherboard with expansion slots, expansion slots used to hold expansion boards, each board has a tranciever on it, 1 band per board, sans amp.
One amp to power all bands, or most bands, I haven't gotten that figured out yet.
Several antennae outs, selectable by configuration of boards (i.e. com1 com2 com3...)
LCD display.

Am I crazy? Doesn't sound simple, but it DOES sound possible.

Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

i built a 9' diameter loop some years ago, using 6-wire fone cable.
strung it thru 1/2" soft copper tubing. tied the ends together, so as to
have one continuous loop of wire. i tuned the loop with switched bank of
capacitors. too much wire will lose signal, thru the IR losses.

as you can tell, i prefer tuned loops to broadband loops.

general rule of thumb: make the loop as large (in area) as possible.

>"time-domain discriminator" might work?

There is a 5 GHz wireless LAN by Radiolan that uses pulse position
modulation (on a carrier), and is based on four slightly different timings of
pulses of a relatively low rep rate. The receiver locks onto the
rep rate and then looks for "jitter" of one pulse relative to another.
Perhaps Time Domain does this.
>

Nothing in any of the literature about impulse radio that I have
seen refers to high stability timebases. What they claim is
furnished by modern technology is picosecond time interval measurement
(see the front page of Friday's USA Today for a photo of said
chip).
>
>-- jm KE5FX

It should be kept in mind that no impulse radio is legal at any
power level because it produces intentional radiation in forbidden
bands (See FCC part 15). We can all speculate what the chances
of the FCC having a religious conversion on this topic and allowing
radios to overlay existing allocations are; this observer thinks that
is a long way off if ever and in any event probably after Time Domain's
patent expires in 5 years. According to what I read, the FCC hasn't

even issued an *experimental* license for impulse radio, and you
can get those licenses for almost anything. And if you thought
the FCC was a tough sell, its a pushover compared to ETSI in Europe.
Then there is the rest of the world.

> Perhaps Time Domain does this.

Perhaps, although in a carrier-less mode you'd theoretically have to
examine the entire 1 GHz or so worth of frequency space to lock onto the
transmitter's PRN sequence. That is what bugs me about the Fullerton
stuff -- it seems to me that the "time domain" advantages could come
into play only after a synchronous link is established. Especially at
the microwatt ERP levels they are talking about, that must be the one of
the toughest hurdles to overcome. I note that most of the micro-power
impulse work at LLNL is geared toward single-point applications like
burglar alarms, studfinders, and such.

> Nothing in any of the literature about impulse radio that I have
> seen refers to high stability timebases. What they claim is
> furnished by modern technology is picosecond time interval measurement
> (see the front page of Friday's USA Today for a photo of said

True, I stand corrected... although I'm still not sure what
ultra-precise time interval measurement does for them in an
asynchronous, low-duty-cycle system.

> It should be kept in mind that no impulse radio is legal at any
> power level because it produces intentional radiation in forbidden
> bands (See FCC part 15).

But they are running at such low power levels as to be virtually
undetectable, much less interfering.... basically they are trading BW
for log(S/N) in the Shannon equation. That is what seems so intriguing
to me about the concept -- a few microwatts of power can go a long way
when it's synchronously recovered in a 1 GHz channel. It sounds great
until you start to think about the practical implications of the
'synchronous' part.

> We can all speculate what the chances
> of the FCC having a religious conversion on this topic and allowing

Could very well be. There is also the issue of the government not
wanting We The People to be messing with any more non-interceptable
communications modes than we already are.

> According to what I read, the FCC hasn't
> even issued an *experimental* license for impulse radio, and you

> Then there is the rest of the world.

Still, you can imagine the radio spectrum looking like a very different
place in the next few decades, if even a fraction of the hype is to be
believed. Someone on Slashdot was pointing out the grim implications
for SETI, and the dangers of assuming that the rest of the universe uses
frequency-domain carriers. :-)

Above 2 or 3 MHz Litz wire offers negligible improvement.

This is because, to have any effect, the diameter of individual copper strands must be less than the skin depth in copper at the frequency of interest.

The skin depth in copper is approximately 0.0026 / Sqrt (F) inches where F is the frequency in MHz. And each strand must be individually insulated.

Copper wire cannot be drawn down to such small diameters as are needed at the higher frequencies.

The only way to increase the Q of a coil of given inductance at HF is to increase its physical size. Double the length and double the diameter allows the same inductance to be obtained with fewer turns of much thicker wire.

Very roughly, doubling all dimensions doubles the Q until radiation resistance losses begin to take effect.

As Mike says, you end up using copper pipe (as in magloops).

There's a Web page that lists a number of free/open news servers:

http://home1.gte.net/docthomp/servers.htm

Most servers are read-only, but a few allow posting as well. Also,
many of these will not allow access if you have reverse DNS disabled.
(This may be the case if you're using the news reader at work (Who,
me?) and you're behind a company firewall.) The quickest way to find
out is to just try servers in the list until you get one that works.

Dave

there are
> several other news servers available on the net who don't limit access.
(Are
> free.) The one I'm using now is one such server...

I may be the only person on the list with this problem, but if I am using
the net from
work the NNTP ports are blocked via our firewall so I can't connect to ANY
news server and am limited to using Deja News to read newsgroups if I want
to do so during break, etc.

Now at home, no problem. :-)

If you are crazy then so am I for reading it all the way through. I used to have an Apple][e and I had several slots available. I found that I had access to the data and address busses so I used a simple address decoder and bi-directional data latch. I was then able to pass information to and from my own boards using just BASIC! That is how I built my first EPROM burner.

I do not know how the PC is structured but it should not be too difficult to do something similar with a little research. I know that the printer ports are memory mapped and I still use them for passing information between my three PC computers, also using BASIC programs.

I hide my low-tech BASIC programs by compiling them to EXE files and no-one knows the difference (well, not many anyway). As regards the wireless, a parallel-load synthesizer could easily be programmed with frequency information so your one card per channel idea could be extended to one card for many channels.

Don't ask me to do anything about it, but I just replied to let you know that it should be quite possible to build a complete low-power inside the PC and have some quite sophisticated functions with very simple software.

Perhaps you may want to post that suggestion to my messageboard? the address is: http://www.insidetheweb.com/mbs.cgi/mb426630
I will not reply to it but you may get some feedback from elsewhere.

Best regards Harry

3998. Heathkit TC-2 Tube Checker Manual

Hello all,

I have just acquired an old regen chassis that I hate to see stripped out for parts. I'd like to restore it and make it operable, but I need to find out what it is first, and if anyone has the schematic. I don't have the coil or tube lineup (I'm sure it's coil, detector, and audio but I'm not sure). The underside components are all there and seem to be in good shape. There is a small inductor shaped like a very thick washer that's loose and I have no idea about. It's hanging under the chassis. A schematic would be very helpful!

It appears to be a Pilot 'kit' - the kind that had all the parts and panels, but you had to drill the holes yourself.

I have photos at:

http://www.boatanchors.com - then click on the link at the top of the page 'Help identify this receiver'.

I'd like to find a schematic, and a replacement vernier for the right dial which is broken. If anyone has one or is at all familiar with this little regen, drop me a note.

Thanks and 73

Hi,

I am looking for schematics of other info on building a sub micro (<3 grams in weight) FM radio control receiver for model aircraft. Does anyone know anything about these type of circuits (the transmission is FSK modulated on the 35MHz band). I was thinking along the lines of a programmable PLL where a pic micro sets the centre freq of the PLL to the transmitter xTal freq. and directly decodes the signal. Would this work?

Any Help would be apreciated

Joe

Hey Reg,

Check out:

http://www.neewcweb.com/litz/rd14m28m.htm

They make a Litz wire specifically for use between 1.4 and 2.8 MHz.

Some good tutorial info on Litz wire resistance calculations at:

http://www.neewcweb.com/litz/litz01.htm

This stuff should be better than solid wire of the equivalent AWG number.

thanks,

-Charlie

>> power level because it produces intentional radiation in forbidden
>> bands (See FCC part 15).
>
>But they are running at such low power levels as to be virtually
>undetectable, much less interfering.... basically they are trading BW

The FCC rules don't say anything about that. They just say you
cannot have *any* intentional radiation in a forbidden band.

>for log(S/N) in the Shannon equation. That is what seems so intriguing

In Shannon's equation, you eventually become power limited at -1.6 dB
of Eb/No (energy per bit over noise density). This is only 2 dB better
than a state of the art rate=1/2 turbocode QPSK system.

>to me about the concept -- a few microwatts of power can go a long way
>when it's synchronously recovered in a 1 GHz channel. It sounds great

Again, spreading out the energy doesn't make it go significantly farther.

Also Lawrence Livermore seems to have claimed to invented it as well and files patents though their patent claims were files after time-domains. The interference issue is definitely a big one as Livermore sold licenses to several commercial customers, and sort of downplayed the fact that the FCC has not issued a type acceptance on the technology. So the licensees are suing since they spent a pile of money on a technology they can't use.

I saw mention of pulse on carrier wave, that sounds like an adaption we could use. What kind of data rates can you get with that technology and say compared to using spread spectrum?

Quantity of 10 New NiCd battery packs at Ebay. to find the auction first go here:

http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=boatman9&sort=3&since=-1&page=1&rows=0

then select the auction hyper-link for the batteries.

These are Mitsubishi cellular telephone battery packs. Each pack contains five (5) size AA Nickel Cadmium rechargeable batteries. These are rated by the manufacturer at 850 MilliAmp hours. Since each cell is nominally 1.2 volts the entire pack is a 6 volts. These packs can be used by soldering onto the terminals or you can cut them open and remove the cells for use individually.

Connection to a digital camera can be made by soldering a small power cord onto the battery's positive and negative terminals and then attach the correct plug for your camera on the other end of the cord. Since the batteries are 850 mAH the correct charge rate is 85 MilliAmp for 14 to 16 hours. If you use the batteries individually you can simply charge them using an ordinary AA NiCd charger.

You get 10 of these packs for one price.

Pictures are here ==> http://members.xoom.com/simmtech/nicads/

Hi Charlie,

Here is a letter I saved a while back, I think it may have some useful
info.
This is where I learned you need to pick the proper size Litz wire for the
frequency of interest. I don't know what quantities the company sells in.
I'd be interested in the details of your project, I once made a coil that
we think we measured a Q of 893 at 1.8 Mhz.(1/4" copper tube)

Good luck
Mike

http://www.wiretron.com/litz.html
www.neewcweb.com/litz/litz.htm

I've been working a problem on current rating (ampacity) of Litz wire.
This
problem is not as simple as for solid cable. The copper conductor is
intermingled with the separator material, thus lowering thermal transfer.
On
the other hand, the construction results in larger surface area due to the
nonconductive center.
Futher complications are frequency related proximity effects. In general,
Litz
wire is selected for operation in a distinct frequency range. For
broadcast
use, highest circuit Q results at the lowest frequency (if not voltage or
current limited). This means selection is predominated by the lowest
frequency
regime. The individual strand size is selected for that frequency.
New England Wire has a good technical reference for calculating resistance
of
Litz wire.
See <http://www.neewcweb.com/litz.htm>.
The formula for resistance is given on
<http://www.neewcweb.com/litz02.htm>
from Terman, Radio Engineers Handbook, pp 30-83.
Rac=Rdc(H+K(NDi/Do)^2G
where for large cable H=1, K=2,
F = Operating frequency in Hz
N = Number of strands in the cable
Di = Diameter of the individual strands over the copper in inches
Do = Diameter of the finished cable over the strands in inches
and G=(Di/10.44)^4*f^2 is the eddy current factor

An alternate equation I found was referenced in a reference on WWVB.
See
<http://guppy.nosc.mil/services/sti/publications/pubs/tr/1693/tr1693.pdf>
WWVB Antenna and Antenna Tuning System, pp 36-37, by Peder Hansen and
Darell
Gish

Resistance of the Litz cable is given by
Rac=Rdc(1+ (f/fb)^2)
where f=frequency and fb=critical frequency
fb is defined as the frequency at which Rac=2*Rdc
This refers to a paper by Hansen in 1983 on the Cutler, Maine antenna which
shows a correction table for fb based on wire spacing ratio in a coil
(S/Do)
and coil length to diameter ratio (L/D)
For practical broadcast coils L/D=1 and the correction for fb is about .8.

For f<fb Imax=600Do(n Di)^.5
For f>fb Rac is multiplied by ((1+ (f/fb)^2)/2)^2, for f<fb correction is 1
This factor corrects for use of a cable above its designed frequency range.

Two rule of thumb parameters are also given for rating the cable.
First: 1A/mcm (1000 circular mils)
2nd: 1/4 W/in^2 surface area

Using 1/4 W/in^2 and the corrected formula Rac=Rdc(1+ (f/fb)^2) yields
similar
results to Imax=600Do(n Di)^.5.

Using 1A/mcm is conservative for f<fb. (~ 1/2 the heating power)

So, the question I pose is what are reasonable parameters for setting cable
ampacity? 1A/mcm or 1/4 W/in^2 or some other formula?

>Roy Lewallen, W7EL

Roy is right. What the catalog means is that if you terminate it with
a 330 ohm *resistive* source/load, it will meet its specs. Other resistances
will give different (usually less desirable) responses. Adding reactances
has different effects. I actually did a fair amount of experimenting with
using non-standard and reactive terminations with some Murata 10.7 MHz
ceramic filters specified for 330 ohms to change the response to suit
my needs. This is discussed in my 1995 and 1996 IEEE Frequency Control
Symposium papers on my web site: <http://www.karlquist.com> (see
"professional papers".)

Many crystal filters specify a termination that is a combination of resistance
and reactance, BTW.

> with the customers !! 73 to all

What is your point? Are you claiming that Bird watt meters do not
meet their specified accuracy?

Your comments raise a few questions, such as how do you know that the
true power was 40 watts and what were the ranges and conditions of
the Bird elements with which you made those measurements? And also,
if you were serious about the last comment there's the ethical
question of why you were showing a reading to your customers that you
believed was false and fully 25% greater than the true power.

New standard Bird 43 meters are specified at +-5% of Full Scale in
carrier mode (and +-8% in PEP mode where that's available). So, even
if the true power was 40 watt (and you didn't explain how you reached
that conclusion), then measuring it with a new meter and new 250 watt
element will not guarantee a reading any of better than around 237 to
263 watts, and using an old and mishandled meter and element of any
rating may also not give a particularly accurate measurement.

Hi, Dave.

I talked to a friend of mine who is very knowledgeable about these units, and he seems to feel this was likely a homebrew. From the photos, it seems there are three tube sockets. One would be used for a coil, another for the regenerative stage, and the third for an audio amplifier. The transformer was likely an interstage between the regen and audio. The (magnetic) earphones would typically be hooked to the battery and plate of the audio amplifier.

It looks like a battery set - that is the tubes were directly heated filament/cathode. It was hard to tell from the pix whether the tube sockets were four or five pin. The resistance control is likely to adjust filament voltage, and the presence of a transformer in the regen circuit was more typical of battery sets than later "AC" sets that used tubes with indirectly heated cathodes.

Regarding the schematic. You are probably best off by finding a typical regen schematic, then tracing out the wiring in your set. There were many minor variations but all followed the same basic approach. From the size of the tuning capacitors (one was tuning, the other is likely a regeneration control) it looks like it was built as a short wave receiver.

The coil will probably take some educated guessing, but if you can find a typical schematic, you might borrow the coil winding data from that project. The coil windings are probably not too critical provided you have the basic windings and taps hooked to the proper places.

It should be straightforward to make the set work again, after all these years. Good Luck!

Hi All,

After Drake's 4NB didn't do much for me on my QRN I decided to cobble something together that would work. While it is still a work I'd like to improve, I have something that works a whole bunch better than the 4NB. I used Ten-Tec's Model 297 accessory blanker for the Scout. The details of the project are on my web site. See them at:

http://www.wwc.edu/~frohro/R-4C/NoiseBlanker.htm

If you have any suggestions, I'd love to hear them.

If you want something really simple, how about one of those switches they use in closets where, when you open the door the light comes on. In this can "lifting" the equipment would open the switch and turn on an alarm.

Or, instead of an audio alarm, you could use one of those strobe lights that are used for letting you know that a phone is ringing (Radio Shack sells them). Better still, use both the alarm and the light.

Good luck.

The consumer radio clocks receive WWVB (in the US).

Temic had the U4221B/U4223B/U4224B/U4226B series for this.

Does anyone know if these are now with Temic, Atmel, Vishay, or ???

P.S. For a good bibliography on radio clocks see:

The following is a copy of a response I made to a similar question a few weeks ago:

I purchased a partial kit (PC board, crystals, and ICs) and built the kit about a year and a half ago. The rig has adequate sensitivity, clear audio on transmit and receive, and the receive current drain is only about 35 mA. After checking out the transceiver, I made the following modifications:

1. The author of the plans seemed to have a misunderstanding of how you measure PEP. He talked about measuring peak-to-peak voltage across a 50 ohm resistor, squaring it, and dividing by 50 to get PEP. He left out a factor of 8. At the time I bought the kit, it was advertised as having 5 to 8 watts output, but mine would only put out about 5/8 to 1 watt PEP. I used a voltage doubling transformer between the output transistor and the filter to bring the PEP up to about 3 watts with a 13-volt supply.

2. The VFO uses a type 2 (red) toroid core for the inductor. Substituting a type 6 (yellow) core (and adding a couple of turns to get the same inductance) improves the temperature stability by a factor of about 3.

3. The VFO inductor is very close to the T-R switching relay and experiences a slight inductance change due to the stray magnetic field. To minimize the amount of frequency shift between transmit and receive, it was necessary to rotate the inductor until the best position was found.

Possibly some of these design flaws have been corrected since I built my kit.

As a field tester for Elecraft, I can tell you that the K2 was easy to build. There were some difficult sections, but mostly these were just tight areas where a steady hand was required. I expect that based on our suggestions, the production units will be even easier to build. I may have to talk my XYL into getting one - and she's not even a ham! But I'll volunteer to build it for her! ;-) It was fun to build!

So, what kind of prior experience did I have before I built the K2? Well, I haven't even admitted this yet to Elecraft yet. This was my very FIRST kit I have ever put together. Heck, even the torroids were fun to wind as I never had done that either! The only soldering experience that I had was a little computer controlled interface I built from scratch for my big rig (I have not gotten the interface to work yet - and it only contains about a dozen components).

My original plan was to warm up with the NorCal 20, but since they both shipped at the same time, I decided to start with the K2. I still need to start the NC20.

I only encountered several problems. Looking back on them, 2 of them should not have been problems, if I knew what I was doing in the first place. In fixing some ground shorts, I etched all around some pins, isolating them from the circuit. Another problem was a solder bridge, or atleast that's what I think it was. There was a ground short, so I removed the component, no short, resoldered the component, and it was fixed. For the experienced builder, these problems would not have been a problem, but I learned a lot in building the K2 and fixing the problems. Wayne and Eric's support was great!

I think that this is a huge testimonial to Wayne and Eric in designing a complex rig like the K2, but making it easy to build. The manual is written for the beginner (atleast the first 2 chapters), by the 3rd, the builder should know the basic stuff. I would definitely go the Elecrafts web page and download the manual if you're thinking of building the K2.

> We eliminated the use of wiring harnesses with our 'wireless' design
> and we also built in key test equipment (volt-meter, freq-meter etc.)
> so that you don't need a room of equipment to align it. Actually only
> a digital VOM is suggested.

Actually, when I first aligned mine, I did not use any external test equipment. I just connected an antenna and aligned the K2 based on maximum receive signal based on how I heard the signal. I later realigned it using meter, although very little change was required. I did use a DMM to double check some resistors, but if you know how to read a resistor (they tell you how in the manual) then you shouldn't have any problems. Just double check your parts placement before soldering!

The K2 is a nice "big" radio in a little package. It was fun to build and even better to operate!

If you would like to see some pictures, goto:

Dear All,
TOKO's manual quotes their ceramic filters as having an impedance of 330 ohm for the 10.7MHz FM ones and various values between 1 and 5k ohm for the AM (455kHz) ones.

Can anyone tell me if this is purely resistive or whether there is a reactive element and if so, how much?.

Regards

Robin Birch

Would have thought that 'impedance' would, by
definition, include reactance (?) Must do, in an
inductor.

One thing that I have done is tune a cheap pocket size AM BCB receiver to a strong station and turn down the volume. Place the BCB radio next to the SW radio and adjust the BCB tuning slightly to get the desired beat note.

ne602 is doubly balanced mixer + oscilator, while LM373 has a simple mixer.

Yes, alot of japanese IC which are very commonly used in BOOM boxes
implement the whole AM RX + FM IF chain +disc in one chip.
EG.
SANYO LA1205 used in SONY ICF2001
LA1206 used in YB400 and countless other BOOMBOX type AM/FM
radios.

Yes you can get data sheets for these in english on the www.

Packaged filters are generally designed to work properly when terminated at input and output with a pure resistance of a specified value. Without information other than given in the above posting, I assume that's what the "impedance" refers to.

The impedance is more or less resistive in the passband, but
soars to much higher (and more reactive) values than 330 Ohms
outside of the passband.

If you try to use the filter input as a load for an amp
or (active) mixer you will see the gain peak either side
of the passband and actually dip in the passband.

You can reduce the effect of this somewhat by using an
"umbrella" filter (a relatively low Q L-C tank resonant
at 10.7 MHz, perhaps with a resistor in parallel with it)
to roll off the load impedance seen by the active device
far from the passband.

This will also give an added benefit of helping to supress
filter spurious responses outside the passband (more as you
get further away, obviously) ... I haven't looked at the
specs on the TOKO ceramic filters in a while ... but the
"el-cheapo" Murata ones are only spec'd for 30 dB spurious
supression, and that only over a band of something like
9-12 MHz ... outside that, spurious responses are not spec'd.
(and can be quite substantial ... particulary the 3rd harmonic
response as I recall.

73,

Hey Reg....

A LOT BETTER!!!
Firstly I'm not comparing S units but rather AC resistance vs. DC
resistance.
I disagree with your pessimistic assesment and I will respectfully attempt
to prove it:

Firstly, here's one datapoint from a manufacturer of Litz wire bundles...

Frequency vs. AWG Strand Size

All Values in KHz

1 To 10.0 - 30 AWG
10 To 50.0 - 33 AWG
50 To 100.0 - 36 AWG
100 To 200.0 - 38 AWG
200 To 400.0 - 40 AWG
400 To 800.0 - 42 AWG
800 To 1600 - 44 AWG
1600 To 3200 - 46 AWG
3200 To 5000 - 48 AWG

So the skin depth demands a rather narrow frequency range for each
AWG bundle configuration to be effective.

Secondly, take a look at the "H" ratio defined at this web site and
look at their product offerings in the 1.6 MHz range. Notice the H
ratio is nearly 1. H being the AC/DC ratio of resistances.
This very excellent reference can be found at:
http://www.neewcweb.com/litz/litz01.htm

I rest my case....

Finally, if it wasn't worth making Litz wire then no company would make
it...
this obviously isn't true...so there you have it.

Cheers,
Charlie

In all my years of working with instrumentation in the mechanical, electrical, and chemical areas, my training and experience tell me that Roy's understanding of percent of full scale is correct. If a manufacturer specifies percent of _reading_, that is exactly what is meant. But percent of _full scale_ is quite different - the actual reading can be in error as much as this percentage of the full scale reading _anywhere_ along the scale. In general, stating accuracy as percent of full scale is done to make a poor calibration look better than it actually is. For those wanting to quibble about definitions, ISA (formerly Instrument Society of America, now International Society for Measurement and Control) publishes a number of International Standards giving definitions of all of these terms.

I suspect Bird is just lazy in not giving better accuracy statements. For example, I have seen precision digital instruments specify accuracy as X% of reading + Y% of full scale +/- 1 count. In this case, the X value relates mostly to how well the true reading matches the divisions of the instrument's scale. The Y value relates more to the errors obtained when switching from one scale to the next. Finally the +/- one count relates to the ambiguity of the digital electronics (such as a counter or A/D converter).

What Bird really needs to do is present a calibration curve of actual value versus indicated value. Added to this should be two additional curves, one above and one below, indicating the 95% confidence limits as determined for a large number of instruments. This sort of statistical accuracy presentation is expensive, obviously, and I doubt if Bird will ever give one.

Percent of full scale is, in my opinion, a cop-out for Bird. Whenever accuracy is stated this way, it means the actual accuracy of any reading will always be worse than the full scale accuracy (unless the reading IS full scale, in which case the accuracy is the full scale accuracy).

It is not correct. High quality meters of all types routinely specify full scale accuracy. Because of quality control of the relationship between "deflection" and "input" they can mark the scale with considerable confidence. The accuracy degrades "gracefully" below full scale.

I definitely do not agree with your comments on this. They are contrary to my experience with high quality laboratory analog meters of many types.

> Virtually all test equipment manufacturers guarantee and stand by the
> accuracy of their instruments.

5% of full scale is 12.5 watts. The error at 40 watts (or 12.5 watts) cannot be "assumed" to
also be 12.5 watts by any reasonable person. That is nonsense and anyone who knows anything about analog meters knows that it is nonsense.

The % error in any high quality analog meter degrades "gracefully" as you go downscale. The errors at less than full scale are definitely related to the full scale accuracy. Pick up a catalog of meters and you will see that the full scale accuracy is what is specified. That does
not mean the meter is "junk" at other readings.

Here is the main idea. A properly designed D'Arsonval meter maintains a certain definite relationship between "deflection" vs "input" over its range. The full scale accuracy is correlated to that relationship. Because of that relationship the scale can be marked with considerable confidence across most of the scale. At this moment I am looking at a Simpson catalog that specs full scale accuracy. Yet the picture shows finely spaced markings all across
the scale. Is this some kind of "fraud"?

Hogwash.

Meter designers and manufacturers learned long ago how to deal with this problem of reproducibility, so that "one" meter scale can be used over and over.

For a rectifier meter the rectifiers do introduce a problem, but with quality control this problem is manageable, and is responsible for a slightly relaxed spec for this kind of meter.
AC meters also have a crest factor problem.

> If the accuracy of the
> Bird 43 wattmeter is not specifed at some points on the scale, as you
> say, then it's useless for making any kind of meaningful measurement,
> as is any piece of test equipment with unspecified accuracy.

My experience with my 43, with its 2-30 MHz elements, is that it is quite "accurate" across most of the scale within that frequency range.

> I'll bet that if you were to send the
> Bird 43 meter to the calibration lab and it measured 30 watts with 40

Baloney. It would be sent to the factory repair shop.

> Most labs will
> return a meter as calibrated if it meets its spec. If it has no spec,
> it can't be calibrated. The fact that the Boonton was returned as
> calibrated doesn't mean that it's dead on, only that it meets whatever
> spec Boonton or your company put on it.

It meets the requirements that Boonton says it supposed to meet. And when it is adjusted at full scale, it is very accurate across a 13 dB range, as determined by accurate RF attenuators.
I have been using these meters for 30 years and I know their quality.

As for going separate ways, go which ever way you like. If that is the way you want to behave
toward me, I couldn't care less.

Yes,
I agree, but what I need to know is what its X and R components are in
case I have to build a matching circuit to it. I'm interested in
matching both the reactive and resistive components in angle, not just
in magnitude.

Cheers

4062. To RF gurus: Phase Noise Paradox???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-14 00:00:00 UTC
From: b_runner@hotmail.com
Message-ID: <3713eef4.10013605@news.eisa.net.au>
Source record: 71235
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

Hello,

Am I missing something here? This is the problem:

Example: SSB phase noise of an oscillator in 1Hz of bandwidth,
relative to carrier:

-30dBc/Hz

[distance from carrier is irrelevant here, it is probably very close
or it is a crappy oscillator ;-)].

Is then phase noise in 10kHz of bandwidth

+10dBc/10kHz ?

I used the usual 'bandwidth noise power' scaling: 10logB. Can there be
more phase noise than actual carrier power? This seems
counterintuitive to me.

Thanks for any insights...

Receivers compared the correct easy way!
Motorola commercial receiver test splitters.
New condition and a great time saving tool!
High quality 4 into 1, 50 ohm RF splitters.
They very well shielded cast aluminum boxes that provide a constant 50 ohm impedance match to compare
all your receivers signals at the same time.
They are small in size! about the size of three cigarette packs side to side.
I will provide new Motorola rg58 crip on connectors needed to path to your radios.
They have common connectors used in Motorola service shops.
I will sell each splitter for $29 or less if you want more than one.
I would also trade just about any ham item for a bunch of them.

Thanks for interest,

The distance from the carrier is very relevent. The phase noise varies
as a function of frequency from the carrier, so you need to measure
it over frequency until it bottoms out below the sensitivity of your
measuring equipment. Don't assume it's flat until you measure it.
If it helps your understanding, use dBm/Hz instead of dbc/Hz.

Don

The noise this high is probably very close to the carrier. It
probably drops very rapidly further from the carrier. You must
therefore do an integration of P(f).df to get the true power in
the 10kHz span.

Source record: 71244

On Tue, 13 Apr 1999, abcd1234 wrote:

> ne602 is doubly balanced mixer + oscilator, while LM373 has a simple mixer.

Actually, the LM373 has two mixers, both of which are double balanced. They were Gilbert Cell mixers long before I heard the term, which seemed to come into popularity when the NE602 hit the scene.

One mixer is the IF strip with the gain control pin. It's used as a gain control element. But in reality it could be used as a mixer, if you use the gain control input as the input for the second frequency. One of the diagrams in the application note actually shows this useage. It's funny, but if you look at the block diagram, it looks like there is a stage of gain, the mixer, and another stage of gain in that IF section, when in reality it's not much more than the mixer alone.

The second mixer is of course most commonly used as the detector. It too is a balanced mixer, which of course comes in handy as a demodulator since by e-arranging things a bit it can be a product detector, AM detector and FM detector.

You'd see the LM373 most commonly in receiver articles years ago, but they could be used in other circuits. Most of the time the "amplifier section" was used as an amplifier. A few articles used them in transmitters or transceivers the second section ould be used as a balanced modulator, and I think one article showed the mixer in the second section working as both a product detector on receive and transmitting mixer on transmit.

>
> Yes you can get data sheets for these in english on the www.

But this would really depend on the intent of the question. I remember when the RCA CA3088 came out, and it seemed like a neat thing, a receiver in an IC. But the mixer was just a single transistor, and because it was intended for AM reception (specifically broadcast band) it was less than perfect for other modes. The LM373 was meant for communication use, the ICs used in broadcast radios are meant for broadcast reception. While I think some of the ICs do use balanced mixers (getting information can be problematic, and something like the ECG replacement guide lacks enough

information to be clear), I wouldn't count on it in every device. If the detector is built in, you'll have to work around that if you want it for other modes, and even for AM in most cases it won't be more than a simple diode detector. Probably the higher the integration, the harder it would be to transfer it to other applications.

On the other hand, if the original question was about finding useful ICs among consumer ICs, there is still hope. People have used, and described in the magazines, using IC's meant for FM communication. Something like the MC3362 that's a double conversion FM receiver. The first mixer is used as a mixer, and the second mixer is used as a product detector. The MC3357 (there are others with slight variation) is a ust the IF strip for a double conversion receiver (you have to add the first mixer, etc) and it's mixer is a double conversion unit. And as Jan-Martin has mentioned a number of times here, and I've seen the idea elsewhere too, some of the FM detectors, in these ICs or others, can be used as product detectors. It depends on whether the detector is in fact a double balanced mixer, and the actual layout of the IC (some have a hard wired connection that messes up using it this way). But you'd feed the BFO into the limiter stage, and where the discriminator coil is hooked up would be your low level input. You can also use it for AM by feeding the IF into both the limiter and the other input.

If you start looing inside car radios, the IC selection there is often better. They'll have a separate IF amplifier, which may or may not do limiting. I've also pulled MC1350's or equivalents out of car radios and a tv set or two (and they too can be used as mixers, since the gain element is a "Gilbert Cell" though there is amplification after it which might be a problem in a lot of applications). Car radios will also offer up some AM bandwidth ceramic filters.

I've often wondered whether IC chroma demodulators from color tv sets have any homebrew potential. They too have "Gilbert Cell" balanced mixers inside. But their specific use in the IC may prohibit using them as standalone mixers.

With a 250 watt element, +/-5% of full scale is +/-12.5 watts. So it
can read as much as 52.5 or as little as 27.5 watts with a 40 watt
power level and still be within its specified accuracy. If you want
better accuracy than this you'll have to use a different instrument,
or perhaps get the meter specially calibrated against a known standard
of greater accuracy.

People frequently misunderstand the 43's spec to be 5% of reading.
It's not.

It may have been before Barrie Gilbert heard the term, too.

I've had the good fortune to attend a couple of talks by Barrie, and he began them with an overhead transparency of the patent for the "Gilbert cell". He explained that he didn't invent it, and never claimed to. (I feel very badly that I don't recall the name of the inventor!) Shortly after it was invented, Barrie wrote an article in a trade magazine illustrating its use in various applications. Someone later mistakenly dubbed it the "Gilbert cell", and the name stuck. Barrie feels very badly about it and has worked diligently ever since to correct the error, but it seems it'll be the "Gilbert cell" forever. (I believe he begins all his talks with this explanation.)

Barrie has invented many very ingenious and innovative analog circuits in his years with Analog Devices, and is probably one of the world's foremost experts on mixers. But not the "Gilbert cell". As he'll be the first to tell you.

Are you a genuine "homebrewer" taking previously used parts and putting them into your own designed circuits ? Do you have a box of inductors lying round, unable to be used because you can't work out their inductance ? You want to build a notch filter for slow scan TV ; a matching network for that new ATU you plan to build. You've got a one micro-henry inductor and you want to know what capacity is required to tune it to 3.644 MHZ. This program will do that and lots,lots more. Just look at the details on http://www.agegraphics.freeserve.co.uk and you'll be pleasantly surprised at what the program can do for YOU THE HOMEBREWER .

Yes. Your calculation assumes that the phase-noise spectrum is uniform
over a 10 kHz bandwidth, which is not likely. If it were, then indeed
the noise would be bigger than the carrier, as in an SSB signal with
noise as the modulation. The anomaly arises becuase -30 dBc/Hz is really
BAD. Normally, phase noise is so low that even over a considerable
bandwidth, the total power is well below the carrier power.

> It's not

This is not correct.

Within the past month or so, I purchased a *new* Model 43 with a *new* 250H element. I compared it with a recently calibrated Boonton Model 92B RF voltmeter and 50 ohm load setup. The readings compared as closely as I could read the scale at all levels from 10 watts to 250 watts. I found this to be impressive. I found the accuracy to be quite a bit better than the "guaranteed 5% of full scale".

The meter scale on the 43 is highly compressed at full scale but spreads out greatly at readings below full scale and is easier to read. For example, midscale is about 80 watts. At 40 watts the error is not +/- 12.5 watts for a 250 watt element. It is definitely not off by 31% at 40 watts.

5% of 250 watts does not imply 12.5 watts at "all" meter readings. That is not what the term means. In fact, the term doesn't really say much of anything about the accuracy at lower readings.

The manner in which they mark the meter scale indicates the confidence they have in those markings. The validity of the markings is verified at the factory, where they have made more than 230,000 Model 43s. The skeptical owner should verify this for himself, as I did.

The nonlinearity of the meter scale has to be considered.

I also checked my new 1000H element with the same results.

Which part of my statement is not correct: That the Bird accuracy is not as I said, that readings of 27.5 to 52.5 watts for a 40 watt signal are within its specified accuracy, or that you have to use a different instrument to get better accuracy than this? If you're referring to the last of this list, is your sole evidence the measurement of a single new meter? Certainly, any single meter or even the vast majority of meters could be much better than the specification. None should be worse. And a given one can be calibrated or verified to better than the specified accuracy, as I suggested in my posting. But it's perilous to infer the accuracy of all meters from a single sample. If all Bird meters were as good as yours, it would be foolish for Bird to specify them so loosely.

If "5% of full scale" doesn't mean 5% of full scale, then what does it mean? If I measure, say, 40 watts, exactly what range of power could actually be going through the meter with certainty guaranteed by Bird? If they can't specify a range of values, then there is no specification at all. I say this as a person who has spent most of his career designing test equipment, all with carefully defined specifications, although this is very basic metrology.

Out of curiosity, what was the specified accuracy of the Boonton you compared it with?

Something that may cause some confusion.....

The units of noise should be thought of as dB(mW/Hz) ...dB relative to 1mW
in a 1 Hz bandwidth...as this is the way that it is calculated.

Although everyone writes it as dBm/Hz this may cause the uninitiated to
become confused as to its true meaning.

There are two types of antennas that you could use. The first, which I would recommend, is a multiturn loop. It should be as big as you care to make it. Don't worry about making it too big at these frequencies.

The second is a voltage probe antenna. This is simply a short (_very_ short at these wavelengths) vertical antenna---working against a good ground connection---feeding a high impedance amplifier, typically with an FET first stage.

The reason I prefer the loop? You can shield it against locally induced electrostatic noise. It also has a null which can be used to reject interference..

The vertical will pick up any and all signals, including noise and interference.

As far as the receiver is concerned, do you have a good quality shortwave receiver (Kenwood or Yaesu, for example)? Build an up converter using a stable crystal oscillator. A crystal at 3.5 MHz, for example, fed into a mixer will shift 0-150 kHz to the range of 3.5 to 3.65 MHz. Palomar Engineering used to sell such a device, but I do not know if it is still available.

The mixer should have good strong signal characteristics to avoid problems with nearby MF broadcast stations. Of course there should be a 150 kHz low pass filter in front of it.

If the filter is after a mixer it would be better to use a diplexer.

A mixer works properly only if it is terminated in the proper impedance at
all frequencies, not just the desired one.

>(rfp@rfparts.com)

Les 6146W sont des 6146 renforc�es du point de vue de la dur�e de vie et de la r�sistance aux chocs et vibrations. Les caract�ristiques �lectriques sont les m�mes. La 6146B par contre, est plus grosse, �lectriquement parlant. Selon les sources, on trouve effectivement des 6146, 6146A et 6146W � des prix int�ressants. La 6146B est g�n�ralement plus ch�re. Comme dit, �a d�pend des sources. Les prix des tubes diff�rent sensiblement selon les vendeurs.

Il faut d'ailleurs remarquer, que les types de tubes utilis�s de fa�on intensive sur le mat�riel militaire, se trouvent aujourd'hui � bon prix alors que les tubes grand-public (surtout ceux de la p�riode plus r�cente) sont � un niveau de prix sensiblement plus �lev�, surtout s'il s'agit de tubes de d�flection lignes. Ce ph�nom�ne d'abord surprenant est du au grand nombre de tubes mis en stock durant de longues ann�es pour le mat�riel militaire en service. Maintenant que la p�riode de stockage prescrite arrive � sa fin pour de nombreux appareils, les stocks sont liquid�s � bas prix, si jamais on trouve un acheteur, ce qui n'est pas toujours le cas.

Thanks for the responses,

I couldn't find the LA1205 or LA1206 data sheets on the Sanyo web site. I did find info on the MC335X-MC337X parts. I have found others like these but they all are designed for FM use with limiting amplifiers. I am interested in devices for HF SSB/CW use. The idea of feeding the LO/BFO into the limiter is an interesting one that I may try.

I do have some MC1496 devices (Gilbert cells?) and MC1350's which I plan to experiment with for mixers and amplifiers. Plessey also had some devices on the market in the '70's but they don't seem to be available today.

Thanks,
Ed

==========
Unless you can say HOW MUCH better the stuff will be you
don't know what you are talking about.

I suggest any improvement at 2.8 MHz will be less than the
thickness of the needle on the S-meter.

And at higher frequencies it will be even less !

And if it costs 1000 times more to purchase the improvement
equivalent to the thickness of the S-meter needle - is it
worth it ?

The same improvement can be obtained by increasing the size
of coil wire. Say from 18 to 17 gage.

Cheerio, Reg.

Norm OM,
C'mon now. That B&W response sounds like the canned lawyer-authored boilerplate that almost any company nowadays is inclined to tell anyone who asks how to repair a piece of their equipment. I would not hesitate to repair the can. You did not say what the damage was, but if it can be completely opened up and pounded back into original shape, and if it is steel or otherwise solderable, you can solder it with a soldering gun or iron, after cleaning out whatever is left of the oil, of course. I would use paper towels, and a bit of paint thinner to clean up the rest of the transformer oil in the can. Get it nice and clean and shiny, then address the soldering, if it is necessary. You can also epoxy any holes shut, using structural two-part epoxy. I have solded car gas tanks, after they are totally clean, of course, without problems. Use of a soldering iron or gun is flameless, and with the absence of any volatile vapors, is safe. You can also, in addition, fill it with water, except where you want to solder the can, and solder it that way. There are lots of ways Norm.
You can refill it with standard, (drinkable even), mineral oil.

73 and GL,
Don, W6JL.

I was following along pretty well until the part about 'negative energy'...
Yeah, you can have negative energy flow, but energy's gotta be conserved
somehow!! Think 'unterminated transmission line'... where does the
energy go?? High SWR, reflected waves, hmmmm.... I bet the final amp is
getting pretty warm by now.... !!! Unless you use a tuner, which
probably will dissipate some heat itself.

Of course, you can also have ground losses, radiation patterns straight up
into space, maybe others I haven't thought of. The point is, there are a
lot of possibilities besides breaking a law of physics that hasn't been
disproved in 100 years. You'd have to eliminate all those things and then
some to make me drop my trust in thermodynamics. (Not faith.. trust...)

Ok, here we go, foot in mouth time :-).

The circuit that I am drawing up is for the RX section of a 50 MHz QRP FM transceiver suitable for UK novices. It'll use a PLL for the local oscillator/modulator based around Philips devices.

The RX is going to be:

Preselector (broad band input - Q set to cover the 50MHz band)
some RF gain.
Mixer
10.7 MHz IF strip
455 kHz IF IC for second IF, detector and AGC generator (from the RSSI circuit).

I was intending to use ceramic filters for the 10.7 MHz IF strip as they don't need any setting up and this is intended for novices.

Now, this is where I make a pratt of myself.

1) I'm afraid that I don't actually know what a diplexer as opposed to a mixer, either single or double balanced, is. Is it just a different name for a particular type of mixer or is it something totally different?

2) Every traditional superhet that I can think of uses some form of mixer, often quite simple, followed by a tuned amplifier or filter built from either wound or ceramic/crystal components. Does this mean that every superhet is wrong or is there a "hidden" requirement to the tuned amplifier's or the collector/drain filter in a simple mixer's that their input impedance should be constant across all frequencies.

Forgive what may be a dumb question but part of the exercise is for me to teach myself some more RF design skills, the coarser, let alone finer, points of which I am sadly lacking in.

Cheers and thanks for the input so far

Robin

I did a little more research and found some Philips parts that show promise. The TDA1072 and TDA1572 have all the necessary functions and look like they have a port for injecting a bfo signal into the detector. The detector is described as a 'balanced full-wave' detector which may work for SSB/CW demodulation. There are many other AM/FM circuits but they don't have a port for injecting the bfo signal.

Does anyone have experience with these devices?

Ed

> signal are within its specified accuracy?

Yes. That is what I said. Suppose you read 12.5 watts. Does that mean the power is between 0 and 25 watts. Read the scale on a 43 in good condition and you will see that this does not make sense.

> If all Bird meters were as good as yours, it would be
> foolish for Bird to specify them so loosely.

It would not be foolish at all. See explanation below.

> If "5% of full scale" doesn't mean 5% of full scale, then what does it
> mean?

It means what it says and should not be extrapolated. If the reading is 250 watts the error can be +/- 12.5 watts (0.22 dB). It does not say that a 40 watt reading is also +/- 12.5 watts. In certain applications, for best "percent" error, we would try to pick a plug-in element whose full scale coincides with the power that we are interested in.

The maximum error in watts is not a constant number at every point on the scale.

> If I measure, say, 40 watts, exactly what range of power could
> actually be going through the meter with certainty guaranteed by Bird?

As I said before, the exact accuracy at readings below full scale is not specified (there may be some formula that they use and that my inquiry to them could not determine). It is very difficult and dangerous legally to "guarantee" the accuracy at every point on the scale. My guess is that they computer-check maybe five points in the factory. I also guess that their diodes are tightly specified and hand picked (I have seen this practice also). For reasons of their own they do want to be involved with tight specs on portable instruments that may be misused or abused or operated over a wide ambient temp range (because of the tempco of the diodes).

But if you look at the scale, the markings are very well done, and the pointer is an anti-parallax type for accurate reading. I don't think this is just "window dressing." There is a certain error associated with the ability to read the meter that has to be considered. At low wattage the percent error can increase somewhat because of this. If the needle gets bent because of misuse, or if the meter has an aging effect, these things aggravate errors over time. The D'Arsonval meter does have certain systematic errors with age.

There are digital instruments that are used only in metrology laboratories such as Rock-Col that are used to check things such as 43s, which are then used at the test stations on the production line. In some applications there may be a correction chart attached to the 43.

> If they can't specify a range of values, then there is no
> specification at all. I say this as a person who has spent most of his
> career designing test equipment, all with carefully defined
> specifications, although this is very basic metrology.

I am sure that I know as much about these matters as you do. And I know exactly what 5% of full scale means, and what it does not mean.

> Out of curiosity, what was the specified accuracy of the Boonton you
> compared it with?

It was calibrated by the Rockwell Collins metrology dept. I don't know the exact number but you can be damned sure it is not off by 1.6 dB at 40 watts. Government contracts require periodic and accurate calibration of all test equipment. And the 92B is an excellent instrument that is capable of very close calibration. I use a Boonton 100:1 voltage divider for xmit measurements, and it has been verified also.

The 43 and the two elements that I bought are just a random sample of one each. Also, I am confident that Bird checks the 43 at their test stations to better tolerance than what they guarantee at the customer's site. This is common practice. The guarantee to the customer is more relaxed than their production line test. Companies have to do this to cover their butts. Tek does the same thing, I'll wager.

I also know that the 43 can be abused. I have seen plenty of that.

And if the instrument is initially much better than 5% of full scale, then over a long time, with proper usage, it will probably still be within 5% of full scale. I know that is how I would spec it.

And be sure to filter out the harmonics, amplitude ripple and other spurious.

I infer from this that the noise floor at your arbitary offset is 30dB down on peak carrier power, as for the measurement to be valid you must use the same bandwidth for both figures

>[distance from carrier is irrelevant here, it is probably very close

Why is it paradoxical for more power to be contained in a 10Khz bandwidth than a 1Hz bandwidth ?

If you could gather up all the power in a 10Khz bandwidth and concentrate it in a 1Hz bandwidth, can you see how (intuitively) this would give +40dB signal? This is in fact the basis of spread spectrum techniques and chirping radars.

Dave

I suspect it is a homebrew.

Most of the components are 1920 vintage
and are very common items. Early homebrews
typically used wood breaboards and bakelite
front panels, not metal; so there is a bit of
an anachronism here. The large
rheostat is for controlling the filament voltage
on the two tubes. The tube sockets appear
to be wafers--again a contrast to the earlier
vintage vernier dials and transformer.

The larger capacitor was probably used for
tuning. 140-pF was a "standard" tuning capacitor
value during the 30s and 40s, manufacturers
supplied coil sets for that value tuning capacitor.
The smaller variable was most likely used in series
with the tickler winding, as a throttle control, to set
the regeneration point.

If the tube sockets are 4-pin, likely tube candidates
are 30, UX199, and UX201. Blank 4-pin coil forms
are available from Ocean State Electronics. Antique
Electronic Supply I believe offers 5 and 6 pin forms.

Jim,

That is certainly true of almost all passive double-balanced
mixers (the diode type, which have insertion loss and require
relatively high LO drive.) ... most of which are intended for
50 Ohm source and load impedances ... it is not always equally
applicable to active mixers, some of which can be rather tolerant
of loads which are not equal at all frequecies over a very wide
band.

> different?

In this context, a "diplexer" is a circuit which is designed
to provide a broadband resistive termination at the IF port
of a mixer ... they are *usually* applied to passive, double-
balanced mixers, since that type of mixer's spurious performance
is almost always highly sensitive to the termination on the
output port, "desiring" to "see" a broadband 50 Ohm load (there
are "termination insensitive" mixers, which generally have an
output buffer which properly terminates the mixer's IF port and
buffers it from the external load, but they are relatively more
expensive.)
```

> every superhet is wrong or is there a "hidden" requirement to the tuned
> amplifier's or the collector/drain filter in a simple mixer's that their
> input impedance should be constant across all frequencies.

Many receivers either use active mixers, which may not be as
sensitive to the (broadband) termination, or (if using passive
mixers) ignore the diplexer to reduce complexity at the expense
of spurious and intermodulation performance.

> Forgive what may be a dumb question

There's no such thing as a dumb question when seeking more
understanding of how/why things work the way they do ...
no need to seek forgiveness :-)

That is correct. It is not speced at 5% of the reading, but of full
scale.
That means it could be way off at the lower power readings. Lots of
meters becides the Bird watt meters are speced that way, that is why
for the analog meters, you should try to get the reading on the
upper portion of the scale.
The scale is not linear and the diodes are very poor in calibration
at the lower levels. They are operating in the square low reagon
and could be way off.

I will agree that the Birds are usually more accurate than that. I
work with lab instruments calibrating other instruments every day
and find a quality instrument will normally beat the specs by a
large ammount under controlled conditions, but if they are operated
in a very hot area or very cold area, they can 'drift' near the
limits. Don't know about the Bird, but suspect if you place one at
the extream ends of the temp range, it will be luckey to hold as
near as 2 or 3 %.

Virtually all test equipment manufacturers guarantee and stand by the accuracy of their instruments. Certainly all the companies I worked for did. I've spent many, many hours writing specifications, verifying them, and establishing that I had with high confidence that all instruments would meet their published specifications. The specifications are written so they can be met. If the accuracy of the Bird 43 wattmeter is not specifed at some points on the scale, as you say, then it's useless for making any kind of meaningful measurement, as is any piece of test equipment with unspecified accuracy. I'll qualify that to say that it's useless unless you've specifically calibrated it against a standard which does have known accuracy. (Incidentally, I've heard that at least on some of the ranges, the Bird is near the lower end of its spec at one end of the frequency range and near the upper end at the other. I haven't investigated this personally, though.) I believe that the reason Bird gets by with such a sloppy spec is that they don't have any serious competitor that's willing to guarantee a better one. Or perhaps the market for their instrument feels as you do -- that hey, what the heck, I know they're pretty good.

You mentioned the calibration of the Boonton meter. (I apologize for cutting the quote too quickly.) I'll bet that if you were to send the Bird 43 meter to the calibration lab and it measured 30 watts with 40 applied, or even 12 watts with zero in, it would be returned as being in calibration. You might check this with the lab. Most labs will return a meter as calibrated if it meets its spec. If it has no spec,

it can't be calibrated. The fact that the Boonton was returned as calibrated doesn't mean that it's dead on, only that it meets whatever spec Boonton or your company put on it.

At this point it's clear that you have an entirely different approach to measurement verification than I do, so this is probably a good time to once again go our separate ways.

Check out: http://www.rfparts.com/
Look under RF power modules. There are mitsubishi parts
(probably others as well) which will run 30-40 wats out -
class AB. To get as much gain as you need, you may well
need to use two modules. One low power, followed by the
high power module. These modules are typically 50 ohms
in/out and require only a few bypass caps and ferrite chokes
to implement.

Yes it is by definition of what an accuracy statement referenced to
full-scale is. Read ANY elementary book on instrumentation.

>High quality meters of all types routinely specify full
>scale accuracy. Because of quality control of the relationship between
>"deflection" and "input" they can mark the scale with considerable
>confidence. The accuracy degrades "gracefully" below full scale.

What you refer to here is a different accuracy statement. This implies
accuracy as a percent of reading. This was not what was specified.

As I stated yesterday, precision instruments usually give an accuracy
statement including both percent of reading and percent of full-scale.
Percent of reading accuracy is easy to measure with a linear scale, but
much more difficult with a nonlinear scale. With nonlinear instruments,
you are concerned with two things - how well the scale calibration fits the
instrument response curve, and how well the curve represents reality. The
Bird accuracy statement tells you only that the one reading, that taken at
the full-scale reading of the dial, is within 5% of the actual value. It
tells
you nothing of how well the dial calibration fits the actual instrument
response.

In the instrumentation industry, manufacturers routinely go through the
game of "specmanship". I would much rather have an instrument with an
accuracy of 1% of reading plus 20% of full scale than I would one with 5%
of reading and 5% of full scale. In the first case, I can do one
calibration at the full-scale value and then make any measurement to within
1%. In the second, all measurements are no better than 5%. And when a
manufacturer gives only the full scale accuracy for a nonlinear
measurement, you have no actual idea of the real accuracy at lower scale.
It likely is not as bad as only the full-scale accuracy suggests, but the
only guarantee from the manufacturer is the one point.

>I definitely do not agree with your comments on this. They are contrary to
>my experience with high quality laboratory analog meters of many types.

Please go back and consult the actual accuracy specifications on these meters. The better ones will state accuracy as a percent of reading. The excellent ones will give you a full set of statistics.

You fellows must be talking about the "Tail End Charlie" which I believe
was an APN21. It used a pair of 6J6's in a push pull oscillator around
450 MHz as we used to convert them back to the 430 MHz band after the war.
It used a gated delay line as you suggest. The TR switch was a quarter
wave on one side and a half wave on the other side of a N tee connector.
Apparently the B25 had a blind spot in the rear in which a zero could
slide in and score a hit. This was the radars primary mission but of
course the alarm would go off with low altitude as well. Cliff K7RR

Reg,

The HIGHEST frequency Litz I've seen is 2.4 MHz
and it requires many strands of #48 wire...tiny stuff!
The coils I'm winding are in the 300-400uH range
and operate at 1.6-1.8 MHz. My airwound
4" diameter coil has an AC resistance of
about 4-5 ohms using solid copper #14 wire.

According to New England Electric this can be
reduced by a factor of 20...using a 165/48
Litz makeup. (i.e. 1/20th the AC resistance of
solid copper it replaces). To be honest ground resistance
dominates but with many radials the ground
loss can be reduced and then the coil losses
start to look like bigger percentage of the resistive
losses.

I am looking for an ELF/ULF reciever (ie- 0Hz to 150kHz or as low as possible) either a complete unit or a schematic with ariel design.
Also can anyone recomend the best ariel to try and use on a reciever designed for around 20kHz. I am a bit of a newbe so I dont want to waste a lot of time on the wrong thing!
Any help is much appreciated!

Need xtal notch filter for receiver NPR-method intermodulation immnity measurements. A friend made a 10MHz notchfilter with 70dB notch, 60dB for 1 xtal and 70dB for two.
connected xtals in parallel with tuned circuits (BPF) loaded down to 1000 ohm with critical coupling.
I wish to copy a similiar circuit, but for 3.68MHz. Bought some cheap 3680kHz xtals, but could not achieve more than 30dB notch with one or two xtals.
Seems like Rs is substantially higher for my 3680kHz xtals than the 10MHz xtals, the latter having Rs=1 ohm (?). What can I expect from an xtal? Would perhaps be better to use 10k top impedance in the BPF. The passband should be at least 3.4-4.1MHz with not more than 6dB loss

Runner,
The definition of phase noise indicates a measurement relative to the total signal power. (IIRC. I used to work on microwave synthesisers, but that was a long time ago.)

So no, you can't have phase noise > 0dBc in any bandwidth.

Total signal power is *not* the same as the measured power at the carrier frequency. (Although it is an excellent approximation for clean signals.) For example, sinusoidal phase or frequency modulation with a particular modulation index can cause a deep null at the carrier frequency. Total power is still the same, however.

Before anyone flames this and mentions SSB spectra, I should point out that this thread is discussing *phase noise*. A carrier phase modulated (or frequency modulated) with a real baseband signal will always have a symmetric spectrum, as seen on a spectrum analyser.

If the spectrum is asymmetric about the carrier then there is also an amplitude modulation component, which plays no part in the measurement of phase noise. You must be sure you are not letting AM components interfere with your phase measurements. It's impossible to distinguish them on a spectrum analyser (as it doesn't measure phase).

As you suggested, you can add up the noise density over a band to get the total noise power in that band.
This is actually an approximation that only works for small values of noise. This is called the "small angle approximation".
If you have large values of noise (from your "crappy oscillator" example) then you will get nonsensical results.
The usual rule of thumb employed by RF engineers is that the total phase noise must be < 0.1 radians in the band of interest for the approximation to be valid.

This can be explained in two ways:

(1) convert the phase noise density to frequency noise density. Sum the frequency noise density over the band of interest to give the total frequency noise (called "residual fm" IIRC).
If the residual fm is not significantly smaller than the noise offset frequency, then the small angle approximation doesn't apply.
In this case, we are trying to measure the phase noise density at an offset from the carrier when the carrier is deviating more than the offset away from its nominal centre. Thus we get a crappy measurement.

(2) View the phasor diagram at
http://www.wenzel.com/documents/noise.html
The phase noise phasor component is orthogonal to the carrier phasor.
Theta is the phase noise due to the phase noise phasor.
Tan(theta) = noise amplitude / carrier amplitude.
For small values of theta, we can approximate this by:
theta = noise amplitude / carrier amplitude.
This approximation allows us to assume that the phase contribution of
the noise is a linear function of the noise. Therefore we can simply
multiply the density by the bandwidth to get the total noise, but only
if theta ~= tan(theta) is valid. If it's not, we get a crappy
measurement.

So what do you do if you wish to work with very noisy oscillators?
I suggest using other metrics, such as frequency noise or Allan
variance (no relation :)

We should all remember from our lectures (the ones that we shouldn't
have slept through) that angle modulation is not linear in terms of
converting baseband spectra to spectra of the modulated signal.
Amplitude modulation is linear in this sense. Angle modulation is
approximately linear only for small angles. I think the other posters
who replied to your post forgot this important snippet of information.

Regards,
Allan.
(How many angles fit on the head of a pin? Quite a few if the small
angle approximation holds.)

I had an idea for a car "alarm'. The idea was to hook up a fuel pump cut off switch to a reciever. When you transmit the right DTMF code on that frequency. it kills the fuel pump and stalls the car.

If anyone actually tries this, I want a 10% cut of the profits. :)

From the ones that I've seen physical separation is used with the
antennas on opposite wingtips. This works best with a metal airframe as
the wings and fuselage providing screening. How well this would work
with a plastic, wooden or fabric airframe I don't know.

Hello again Charlie,

DC/HF resistance values are not relevant to the improvement in Q of coils due to the use of Litz.

What matters is the ratio of the HF resistance of a Litz-woven wire to the HF resistance of the solid wire of the same overall diameter it replaces.

Above a few MHz the improvement is tiny. At higher frequencies Litz has a higher resistance than solid wire of the same diameter. It is more economic just to increase the diameter of the solid wire or convert to copper tube.

Litz is at its best at a few hundred kilo-hertz such as in 110 KHz, 455 KHz and 1.6 MHz IF transformers. Have you ever seen any Litz-wound 9 MHz IF transformers ?

Manufacturers will continue to manufacture it for as long as there are customers to buy it.

Yours, Reg.

My little homemade 6J5/6L6 transmitter is only happy with crystals in FT-243 holders, so I'd like to trade away, one-for-one, various crystals in HC-9 holders.

Want: 30-meter xtals (10.101 to 10.119 mhz) in FT-243 holders

Trade: Crystals in HC-9 holders (the 3/4-inch by 3/4-inch, sturdy aluminum holders):

40 meters: 7.005, 7.010, 7.030, 7.040
30 meters: 10.105, 10.110, 10.115, 10.120
20 meters: 14.005, 14.020, 14.030, 14.040, 14.050

These little xtals work fine in my various homemade solid-state rigs.

Ralph,
You don't want the readings near full scale. While I was a Calibration
Tech, the method was to keep
the meter reading between 20%-80% of full scale deflection. The middle of the
scale was were the
accuracy was checked.

> also be 12.5 watts by any reasonable person. That is nonsense and anyone who knows anything
> about analog meters knows that it is nonsense.

I have to confess that I know more about oscilloscopes than analog meters. Tektronix scopes not only has specifications on all important parameters but the manual generally contains a verification procedure. This is a list of equipment, and complete setup instructions, for a customer to verify that the scope is meeting its specifications. Some of the larger customers routinely order this equipment at the same time they order the scope, and the scope won't get past incoming inspection unless it meets all the specs during the verification test. I was the project engineer for a 50 GHz sampling head. (I didn't design that sampler, but improved production control on the existing 40 GHz one.) We had to reduce the stated accuracy of the instrument substantially because of the uncertainty in our ability to verify it. (Even such normally mundane items as the uncertainty in connector adapter SWR added to the overall uncertainty.) I have good evidence that a large percentage of the sampling heads would actually do 60 GHz. But we were never able to assemble a system to reliably verify it. So the spec remains 50.

Some typical specifications from my 2246 manual: Step response (5-division step) Rise Time -10C to 35C: 3.5 ns or less. Vertical deflection system accuracy (includes ADD MODE and Ch 2 INVERT) 15 to 35C: Within +/- 2%. -10C to 15C and 35C to 55C: Within +/- 3%. And so forth. You've undoubtedly got manuals for Tek or HP equipment, so know how these instruments are specified.

And every specification is taken literally, by both the manufacturer and the customers. Those specifications which aren't guaranteed are plainly labeled "typical".

> The % error in any high quality analog meter degrades "gracefully" as you go downscale. The

That's nice, but "gracefully" is a pretty loose spec for serious measurement, don't you think?

> Here is the main idea. A properly designed D'Arsonval meter maintains a certain definite
> relationship between "deflection" vs "input" over its range. The full scale accuracy is

> considerable confidence across most of the scale. At this moment I am looking at a Simpson
> catalog that specs full scale accuracy. Yet the picture shows finely spaced markings all across
> the scale. Is this some kind of "fraud"?

Absolutely not. My 260 manual states DC accuracy of 2% of full scale. On the 50 volt range, I expect the reading to be within one volt of the actual value. Period. Anywhere on the scale.

> Hogwash.

Now there's a statement that's difficult to rationally argue against.

"Quite accurate" isn't a specification. I wish all the customers I've designed instruments for were as easy to please as you are. My life would have been much easier! (I can see it now, "Roy's Pretty Good Scopes".)

Yet if the Bird meter were sent to the cal lab it would have to exceed the accuracy Bird says it will meet? How do they decide which meters have to meet spec and which have to be better than spec? Quite a cal lab you've got there!

> And when it is adjusted at
> full scale, it is very accurate across a 13 dB range, as determined by accurate RF attenuators.
> I have been using these meters for 30 years and I know their quality.

I wondered about the spec on the Boonton, and you say "very accurate", and it was used to verify the Bird, which you describe as "quite accurate". By this I infer that "very accurate" is more accurate than "quite accurate". Perhaps we can get the meter manufacturers to standardize these terms for those of us more used to working with numbers. Your cal lab obviously knows how to translate them.

Sorry I've made you grumpy again. I know there's no way of changing your mind once set, but I'll continue posting a bit longer for the benefit of other readers who'd like to decide for themselves what specifications mean.

If I only *try* this, then obviously there is no profit.

Are you willing to chip in 10% of the cost?

Are you a genuine homebrewer, taking previously used parts and putting them into your own circuit designs ? Do you have a bag of inductors lying around, unable to use them because you don't know what their values are ? You want to build a notch filter for RTTY or SSTV: a matching network for that new ATU you plan to build . You've got a one microhenry inductor and you want to know what capacity is required to tune it to 3.644 MHZ. This program will do all that and lots, lots more. Full details are at http://www.agegraphics.freeserve.co.uk you'll be pleasantly surprised. A program by a homebrewer for fellow homebrewers.

I may be dreaming after a night on call, but is this thread going on two lists?
Anyway, here is a repeat from the antenna list:

Going to jump in here to add some controversy:

A couple of years ago I was talking to a novice about coils in IF transformers and mentioned Litz
wire. He asked what that was and I went into a typical Ham explanation of skin effect, surface area,
etc. based upon 46 years of reading stuff when I suddenly thought: Skin effect, 400KHz, weird
interwoven bundles, this doesn't make sense, and as often happens, the teacher became the student.

Reference Data for Radio Engineers, 1974. p. 12-17

"Rw represents the copper loss in the coil winding. It is made up of the dc resistance of the wire and
the eddy-current losses generated in the winding by stray flux from the core cutting the winding. This
eddy-current loss can be minimized at high frequencies by dividing the wire into many small wires.
This type of wire is called Litz wire."

Someone other than this anesthesiologist might comment, but I suspect that eddy currents in larger
conductor might still a loss rather than skin effect and be the reason that Litz wire is still used.

Your reasonable quality 3.6MHz crystals should have a higher Q than
10MHz and the ESR will be higher up to 100ohms.
Beware spurious responses.

most FM quadrature demodulators will work, TBA120, SN76660, S041P,
MC1351, NE614 etc, you may even use some part of the IC as BFO for the
product detector. I have only tested MC1351P and SN76660N=TBA120 in
multimode demodulators
One problem with some quadrature demodulators when using them for a
different application is crossover or harmonic distortion, but you may
not hear it

I have a 10m to 2m transverter board that provides
5-10mw linear (all-mode) output on 2m.

I am looking for a kit, module, or adapted rf strip that
will get me 10-30 watts output (all-mode) from the
transverter's 5-10mw drive (more power is better than
less since this will often be driving a 170w 2m amp that
likes 20-30 watts of drive for full output, but price is an
object as well).

BTW: I am not in a position to build a circuit up from scratch
at the moment, but I can handle a kit.

Thanks for suggestions, offers, and/or referrals.

> accuracy was checked.

That does make some sense. The top end of the scale is quite crowded and the 20% to 80% has much better resolution. Below 20% the diodes can effect the readings at high/low ambient temps.

But if you look carefully, the top end can be read accurately, although it requires more effort. The Bird 43 is well marked and readable.

The big fallacy here is that if a meter is specified 5% at full scale (all meter mfrs do this) that it is somehow worthless any where below full scale because it is not officially specified everywhere. This is contrary to the common knowledge of those who are knowledgeable about D'Arsonval meters.

The correct viewpoint is that a 2% full scale spec (very common) is, believe it or not, a measure of the quality of the meter across the rest of the scale. It is not true that the rest of the scale can be "anything".

A meter that is accurate at zero and full scale, but highly inaccurate elsewhere is not a *reliable* meter *anywhere*. It is poorly designed.

The "art" of meter design is to get a movement that is as reproducible as possible. This movement cannot have gross systematic errors because that would make that goal impossible.

Source record: 71176

One I worked on in the early 70's that had been around a while then (APN-141) transmitted a pulsed signal and used a regenerative receiver to look at the return. It was small and pretty light even with technology available then (and it was old in the early 70's!). The regen receiver was something akin to a super-regen, in that it was gated. The gate was delayed from the transmitted pulse, and the delay time was proportional to the altitude. Feedback let the gate delay track the elevation. I only worked on them in the shop; I never heard what sort of trust they garnered with pilots.

Cheers,
Tom

Much as Doppler radars work... except there the FM comes from the motion of the target relative to the transmitter. Also similar to another technology developed during WWII...

[I've appended my e-mail address to this query. Makes it easier to respond!]

My little homemade 6J5/6L6 transmitter is only happy with crystals in FT-243 holders, so I'd like to trade away, one-for-one, various crystals in HC-9 holders.

Want: 30-meter xtals (10.101 to 10.119 mhz) in FT-243 holders

Trade: Crystals in HC-9 holders (the 3/4-inch by 3/4-inch, sturdy aluminum holders):

40 meters: 7.005, 7.010, 7.030, 7.040
30 meters: 10.105, 10.110, 10.115, 10.120
20 meters: 14.005, 14.020, 14.030, 14.040, 14.050

These little xtals work fine in my various homemade solid-state rigs.

Mike,

What you are really asking is a way to "model" the losses. Yes it can be done using a resistor. The power loss (per unit volume or sometimes unit weight/mass) in any type of core material is a function of both the frequency and the flux level in the core. I am assuming here that there are no gaps in the core. Gapped cores are much harder to calculate because of the amount of fringing flux you get around the gap(s) which heats up both the core like mad and the coil windings near them if the frequency is high enough. Also the flux level in the core is more difficult to calculate too.

The flux level in the core can be calculated in two ways. The first way you would calculate the ampere-turns you have then look this value up on a graph (B-H curve) to find the flux level (B). The second way is to calculate the flux level (B) based on volts per turn and the core cross sectional area (the equation you use depends on the voltage waveform i.e. sine wave or square wave).

Once you have the flux level you can then look up, on the core loss curves, the point corresponding to the operating frequency and the flux level in the core. The value you get from this type of graph is something like watts/unit volume, milliwatts/unit volume. Sometimes I have seen the loss expressed as watts/unit mass or weight so watch out.

After that it is a simple calculation to find the total loss for a given core volume or weight. And once you have that value then you can use R=(V^2)/P or R=P/(I^2) to find the equivalent resistance. The voltage "V" would be the voltage across the winding on the core and "I" would be the current through this same winding.

Now if you change ANYTHING you have to go through this whole procedure all over again! If you need to experiment with more that one or two operating points you would be better off to "digitize" the relevant core graphs, put the tables in to a spreadsheet of some kind so you can program the spreadsheet to do all of the graph interpolations and calculations for you. I normally use Mathcad to handle this bit of work for me.

Without more data from you such as coil voltage, core geometry, number of turns etc. I don't think anyone here could calculate an equivalent resistance value for you to use.

Lawrence,

The explanation from the "Reference Data for Radio Engineers" handbook, which is correct, is not why Litz wire is used in many applications. Normally we are not interested in high frequency currents being induced (eddy-currents) in to Litz wires.

Your "Ham explanation of skin effect" that you gave to the novice is the normal reason Litz wire is used. Specifically at high frequency the current flows on the surface of a wire conductor in a thin shell all around it. Since the current does not flow through the whole cross section of the wire much of the copper conductor is wasted. Additionally you can see that the shell which is conducting current can be considered as an "equivalent" smaller gage wire where the current flows through the complete cross sectional area. This "equivalent" wire has a cross sectional area exactly equal to the cross sectional area of the current conducting shell of the real wire we started with. Since our "equivalent" wire has a smaller cross sectional area we can conclude that the wire resistance is higher for high frequency AC currents as opposed to the same wire conducting DC (and therefore no skin effect). Depending on the frequency the high frequency resistance of a wire can be 10's of times higher than the DC value. Good Litz wire may have a high frequency resistance from only 5 to 10 percent above the DC value!!

Litz wire aims to solve this high resistance problem with wire conducting high frequency current two ways.

The first way uses strands of small gage wire, each of which is completely covered in a very thin layer of insulation. The gage of wire selected is based on the maximum frequency of the current for which the wire will be required to carry. Normally the diameter of the wire is selected to be around the skin depth (or less) of the current in copper. Using a wire diameter of this size ensures that the current flows through the complete cross section of the small wire uniformly.

The second way is an involved bundling schema for the collection of small wires above to make a particular size Litz wire cable. Since the individual wires in a Litz wire cable are connected together in common ONLY at the ends of a cable, it is very possible for the current through each strand to vary from one another. This typically can happen from the influence of magnetic fields generated from the current flow in the cable itself and magnetic fields from outside the cable. The bundling schema forces each individual wire (in the Litz wire cable) to occupy about every position in the cross section of the cable over a short distance. This has the net effect of exposing each individual wire to the same average magnetic field and thus helps to balance the current distribution evenly among the individual wires

in the cable.

I hope this explanation helps to clear up some of the confusion you have with Litz wire.

Robin,

Good luck with your enterprise, its what amateur radio should be all
about.

A couple of points that may help you:

Firstly decide on how high a performance rx you are trying to design,
especially in terms
of how well it copes with large interfering signals. It is relatively
easy to build a high gain
sensitive rx, but to have one with good large signal performance is a
different matter.
This will probably dictate what sort of mixers you chose.
Passive diode ring mixers usually out perform simple active transistor
mixers, but they are
expensive in comparison.
A diplexer on the mixer output is only necessary if you are looking for
the ultimate in performance.
The choice of single or doudle conversion is again mostly down to large
signal and selectivity
requirements.

If you are trying to build a 'simple' receiver for novices to build them
perhaps it is better
to err on the simple and cheap side. ie single conversion, transistor
mixer etc. (I would
suggest that you consider a crystal filter, especially if you are going
for single conversion,
to try to get reasonable adjacent channel selectivity and a better
rejection further from

channel, with a double conversion rx you may get away with ceramic filters at both IF's)

Final point abouth your suggested line up, agc is not usually necesary on simple FM receivers.
The if strips are desinged to limit, which provides noise rejection, and quieting of the fm noise.

Anyway, good luck, and keep asking questions, that 'real amateur radio'

Charlie,

A coil of 350 uH at 1.8 MHz has a reactance of about 4000 ohms.

With an RF resistance of 4.5 ohms this gives Q approx 900.

At 1.8 MHz, with 14 gage solid wire on a 4-inch diameter former, this is an improbably high value for Q.

Have you calculated the RF resistance value of 4.5 ohms from the length of wire on the coil ?

When a straight length of solid wire is close-wound into the form of a solenoid its effective RF resistance can increase by three or four times. This increase is known as the "proximity effect". It is due to the current not being uniformly distributed over the surface of the wire as it is when straight (as in an antenna wire).

This factor increases the RF resistance and reduces the Q of your coil to 300 or 350 which is a typical value for a coil of those dimensions at 1.8 MHz.

The New England Electric litz data may have been misunderstood. An increase of coil Q by a factor of 20 times, to around 7000, is impossible without superconductivity. But even if an increase of this order were possible there would be no noticeable improvement in antenna performance because most of the loss, as you say, is in the ground radials system.

Charlie, sorry to be so pessimistic. Have you enquired the price of 100 feet of 165/48 Litz ?

For liability purposes make sure that there can be no false triggers (use two digits in sequence) and be sure you can see the car when you disable it. If you kill it as the thief is crossing a rail road track or pulling out in front of an 18 wheeler, for example you could be in for some big liability.

Also, opening the primary to the ignition is a faster way - you don't have to wait for the fuel to be pumped from the lines.

Message-ID: <3717322A.25148D5A@mwci.net>
Source record: 71098
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment,alt.ham-radio.mods,rec.radio.amateur.boatanchors

I took some data on two 2 inch panel meters that I bought in 1946, 53 years ago. For 10 years they were in a CW transmitter, needles flopping around at 25 WPM. A Beckman 310 with accuracy of 0.75% +/- 1 digit was the reference. Both meters are rated nominal 3% of full scale.

Meter number 1: 0 to 50 mA:
Reading Actual % error
50 48.5 3.0%
40 39.1 2.3%
30 29.1 3.0%
20 19.7 1.5%
10 9.5 5.0%
5 4.0 20%

Meter number 2: 0 to 200 mA:
200 198 1.0%
150 149 0.7%
100 102 2.0%
50 51.5 3.0%
25 26.1 4.2%

So much for the intuition that a panel meter that is specified only at full scale cannot be trusted in regions above, say 20% of full scale.

Charlie, I don't know if you have a copy of the Litz Coil Design program LCD.EXE, from the New England Electric Wire Corporation. It may be on their web site but I didn't see it there. The program will calculate the Q of Litz coils, neglecting distributed capacitance effects. In a parallel-tuned circuit the distributed capacitance won't affect the losses because it simply reduces the amount of external capacity needed to tune the circuit to resonance. Your application is apparently for use as a loading coil; in other words a series resonant circuit. Now the distributed capacitance *does* contribute to losses, because more current has to flow through the coil for a given antenna current. I won't attempt to go into more detail about this apparent "Q" paradox because it was beaten to death on the Usenet a couple of months ago. Anyway, LCD.EXE provides a feel for the *best* Q you can expect from a Litz coil. If you don't have the program I can send you a copy.

Brian Beezley's coil analysis program, which was bundled with the ARRL Handbook software for a few years, will calculate the Q (and distributed capacitance effects) of solid-wire coils and allows you to specify the wire material as well as the dielectric used for the form. It may still be available at some ham FTP sites. This would give you a comparison of what to expect with solid wire coils.

I have reviewed the "typical page" of your Homebrewer's Program, and must make a few comments about its utility. The page in question is an aid to calculation for a simple Zener-diode shunt regulator with fixed voltage input and a variable load.

My first point is that there is no help for the more generally useful case where the input voltage and the load current are both variables. If that case is treated separately in your program, it would seem a tad less convenient than covering the whole problem on one page.

The page should indicate that the maximum and minimum current values are in milliamperes, as I suspect is the case.

The resistor (Rs) is clearly a SERIES resistor, not a "shunt" resistor. A simple enough mistake to fix, but one which undermines confidence when it appears on your exhibit page!

The 5-times safety factor for the resistor is appropriate for bridges and structures, but 2-times is usual electronic practice!

The analysis is incomplete without an evaluation of the power dissipation required of the Zener diode. They are available in powers from less than 250 milliwatts to over 50 watts. While 50-watt units are unusual among ham homebrewers, the need to know and allow for diode dissipation is vital.
Just as the range of load currents will affect necessary power rating for the resistor, it matters for the diode as well. Of course, the range of expected input voltage also affects the power rating of both components.

Considering that you want money for your programming efforts, you would do well to secure competent technical review of your product before advertising it to the amateur radio homebrewers newsgroup! Your skill with the graphical interface is admirable, but the program content may not really be ready for release.....

I have just acquired one of the little passive VFOs
that match the Gonset Commander transmitter
(160-6m AM/CW).

I had forgotten that it didn't cover 160m, though I did
know that it didn't cover 6m.

Anyone aware of a VFO or VFO circuit for 160 and/or
6m for the Commander?

Thanks! & 73,

I am also interested in this receiver.
In the radio magazine "Funkamateur" (Februar Issue, i think) was a
report about it.
It sounds not bad, for the low price you will get a lot of fun....

There was a case in New York City some years ago that involved an
apartment dweller who was repeatedly being robbed by way of the fire
escape window. He'd just about had it.
He rigged up a shotgun with a trip wire and blew some asshole's arm off
on the next attempt. He was prosecuted and convicted for assault.
Is it fair? I don't know. I have heard that if the intruder was actually
in the room at the time, it might have been viewed as self defense.
It's a very sick world out there. Try to stay healthy. Lenny Stein.

Jim:
This is mostly done by reducing the tape speed, as it is done in the old tape recorders.
The simplest way is to put an (variable) Resistor in front of the motor.
You can reduce the tape speed 2 -3 times, depending on the torque of your motor.
Maybe you can change the ratio of the driving (normaly done with a rubber-belt, try to change the wheels)
If your motor has to low torque, you can try a pulse-driving unit for the motor to slow it down.
With the lower tape speed the quality of the recording decreases.
But for voice recording it will do with 1/5 speed.

Hope this will help

4172. RX-320 Free Beta Software

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-16 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <37366ae1.13376710@nntp.ix.netcom.com>
Source record: 71107

April 16, 1999

Dear RX-320 User,

Beta version D of the Flexi-Tuner software for operating the Ten-Tec RX-320 is now available.

Many thanks to the many beta testers for their excellent comments, ideas, and suggestions. I have tried to incorporate as many ideas as possible into this beta version.

The biggest change in this version is the addition of a comprehensive logging function (described below).

The major features of the beta version D are as follows:

1. Operates the RX-320 from virtually any desktop or laptop computer, including older 386 machines.
2. Works in either DOS or Windows (this is a DOS program).
3. Implements 34 selectivity filters.
4. All modes: AM, USB, LSB, CW.
5. AGC implemented: Fast, Medium, Slow.
6. Tuning steps down go 1 Hz or up to 1 Mhz.
New! 7. Now includes 3 Khz tuning step for marine channels. Also includes 9 Khz tuning steps for European AM stations.
8. Adjustable squelch.
New! 9. Pause S-meter function on front panel. This eliminates the "chuffing" heard on some RX-320 systems.
10. Bandpass tuning (offset from center freq.)
11. Scanning using scan files. Adjustable parameters.
12. Built-in scan file editor.
New! 13. Built-in logging function with log editor. Easily track, edit, sort, monitor, and export log entries. Items logged include station name (or notation), frequency, mode, filter, date, time, and S-meter reading. Time and date can be adjusted if you want to log in UTC or other time zone.
New! 14. More sensitive S-meter.
15. Almost all parameters adjustable (great for knob twiddlers like me).
New! 16. Tighter code for faster operation.
17. No mouse required (or supported).

Beta version D has been running for a couple of weeks on several computers, including an old B&W Grid laptop (80386 at 25 Mhz), an 80486 machine, and several Pentiums. It works equally well on all the tested computers.

As reported last time, it really is a lot fun to use an old DOS laptop to operate the RX-320 while sitting in an easy chair across the room. By the way, the RX-320 sounds great when played through a good stereo system. Also, I tried Michael Young's idea (April 2 posting on rx320@onelist.com) on how to wire a new serial cable to eliminate the chuffing and crosstalk heard in some systems - this solved my crosstalk problem.

I would be happy to supply free of charge this Beta version to anyone interested who has an RX-320. The software will not function without an RX-320.

The program is supplied along with several scan files in a single zip file. Installation and removal are simple, as the program does not affect any system settings either in DOS or windows (it does not mess with your registry, DLL's, or other system programs).

The program is easy to use - just press various keys to engage the different functions.

Installation, removal, and operating instructions are included.

A final version of the program is expected within a month or so, depending on feedback. It will probably be offered on a shareware basis for a nominal amount (all this work has to be worth something :-) The final version will have greatly expanded scan file and log capacity;and any inconsistencies, cosmetic irregularities, and faults will have been fixed. As always, the final program will be small and easy to install without effects on system files.

If you would like to receive the latest beta version at no charge, send me an e-mail at mktg@ix.netcom.com and I will send you the zip file by return e-mail.

Regards and 73,

David

Source record: 71108

I noticed that Digikey was selling the EPSON SG-8002
programmable frequency crystal oscillators. These can be
ordered with various output options and Frequency stability
over 125 degree range of 50 ppm. From 1 MHz to 125MHz.
They can program them for the frequency you request and
ship in one day.
I ordered some and at about $3 each it took a few to meet
their minimum order.
Well, just as I suspected the one item that was not on their
spec sheet was a problem. Sideband noise (phase noise or jitter).

The 7Mhz one is not absolutely horrible but with a filter bandwidth
of 100Hz the noise 1Kc from the carrier was -49db. and about constant
to 50KHz from carrier. You can check this out with your receiver as
well.
At 50 MHz the sideband noise is only -25db down from the carrier.
Practically useless for as a local oscillator or transmitter frequency
source.

As a comparison a TTL 10 MHz crystal clock and found the sideband noise
to be better than -70dbm 1KHz from the carrier.
By the way you can get custom made crystal oscillators from
JAN crystals for less than $15 each but you may have to wait 3 or
4 weeks. Not nearly as good as 1 day turn around and $3 each but
they are less noisy.

Hi, Everybody,

I disagree. "Distance from the carrier" is *very* relevant.

I'm not sure if this simple rule-of-thumb has been already stated, but in the phase noise measurement business, the resolution bandwidth used for the measurement should be no more than 1/10 the distance from the carrier.

So, to get in as close as, say, 1 kHz from the carrier to measure the phase noise at that point, you must use a res BW of 100 Hz. To measure at a spot frequency of 100 Hz, your rbw must be 10 Hz. This is why it takes longer and longer to make the measurement the closer you get to the carrier.

Once this is done, then the 10 log BW correction can be applied to normalize to noise power density in a 1 Hz bandwidth.

In the original post, which asked what happens when you go from a 1 Hz bandwidth to a 10 kHz bandwidth, it's important to state the separation

because it's very likely that the wider bandwidth would lead to an
invalid measurement. It wouldn't simply be a crappy oscillator, it would
be something like a wideband-modulated signal at that point.

R,

Al

Looks to me as though you have a HY-Q crystal. This is a good crystal company in the UK with a web site at www.hy-q.co.uk
Their online catalog should tell you what you need to know, but failing that, I bet you could send them the crystal, and ask them to duplicate it.

Most of the laser printer PC board processes I've seen use an intermediate transfer stage -- like printing to clay-coated inkjet paper, and ironing on the toner, or printing on a transparency and using photoresist.

However, if you had a laser-printer with a straight path -- one that springs to mind is the Canon SX engine, used in Apple LaserWriter IIs and some HP IIIs -- you could theoretically print toner directly on the PC board.

You can adjust the toner density AND the roller spacing on the Apple LaserWriter II series, and a lot of macintosh artists report successful results from printing on a wide variety of media. I see no reason why you couldn't sacrifice a used-up LaserWriter or LaserJet for printing to PC boards.

An interesting part of the SX engine -- the imaging drum is in the toner cartridge, so you don't have to replace an expensive and unobtainable part if you ruin a drum. Just get an empty cartridge and refill it with toner from the wrecked cartridge, or get bulk toner and refill your own.

I have an old LaserWriter Plus that I bought for a dollar, and a Qume ScripTEN that I got for free...I'm going to experiment and see if either will talk to any computer I have, and be able to make nice PCBs at home.

Best way to figure it out is to head down to the local computer/office
supply stores and get a "test page" from every laser printer in your
price range. Take them all home, cut out a 1" square piece from each
and iron them on to clean PC board material.

Whichever sticks best wins. There's a wide range between the best and
worst.

Which of my statements was wrong?

I hope no one thinks I'm claiming that no individual Bird wattmeter can measure more accurately than its specification. (In fact, I'm quite sure that all of them do. And in many cases, an individual meter with an individual slug might commonly be a great deal better.) All I've said is that the Bird accuracy specification of 5% of full scale means that they guarantee that the reading will be within 5% of full scale. With a 250 watt slug, this means +/- 12.5 watts. They don't have different specifications for different parts of the scale, so it applies to a reading anywhere on the scale. If they stated the spec as "5% of full scale at full scale" with no more information, then the only reading they'd be guaranteeing is full scale, with no guarantee of accuracy anywhere else on the meter. If they specified "5% of reading", the guarantee would be, for a 250 watt slug, 12.5 watts at full scale, 6.25 watts at the 125 watt level, and so forth. But neither of these is what the specification says.

If this is what you disagree with, there's nothing more I can really add to the discussion. Either you take specifications literally, as I do, or interpret them in some other way as Bill does. If I made some other statement that you believe was wrong, I'll be glad to listen to your reasons for thinking so.

From Jack
Interesting - Reading for the Blind adn Dyslexic provides recorders to the sight impaired. The portable ones are the size of a handheld cassette player. They are used to play textbooks etc so the tape speed is very, very slow.

I would venture that the best way to control the speed might be with a pulse-width-modulator chip like the LM3525. I think that this would render more acurate speed control with less battery consumption. The duty cycle is adjusted via a pot, the frequency of the duty cycle is such that their is no apparent interruption of motion.

I'm looking at using a modern National Semi. variable gain amp instead
of discrete transistors or the Motorola MC1350.

Anyone have any particular advice on key parameters?

I have an old redundant colour computer monitor, which was originally used with a 286 PC. I also have a television tuner module, which was liberated from a scrap VCR, and provides composite video and audio outputs. I am hoping to combine the two, along with a simple audio amplifier, to make a cheap television. The monitor has a 9 pin d-plug on one end, but I am not sure what type of signal it needs. I therefore need to process the composite video signal in such a way that the resulting output signal will drive the monitor. Is this possible? I would appreciate it if anyone could suggest how to do this, or if anyone can tell me what sort of input signal the monitor requires.

Thanks, John Cunningham.

Don't bother. Sell the monitor for what you can get and buy a cheap TV.
You'll have to duplicate _all_ of the functions of the TV, except the high
voltage section, and if the monitor doesn't support interlacing, the result
won't be all that great anyway. (that's NTSC system, PAL or another system
may have better viewing results, but the effort to do the conversion is the
same.) What you essentially need is a TV chassis minus the HV section so
that you can then connect the color gun drivers to the appropriate pins on
the monitor connector. (if the VCR was scrapped because of the tape
mechanism and it had A/V outputs, you probably threw away 80% of the
circuitry you needed, lacking only the color demodulator and gun drivers) If
you still want to do this, I or someone else can get you the pinouts to the
connector.

4197. TEK 1502 and antenna measurment?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-17 00:00:00 UTC
From: Ken Linney <ken@g3uda.demon.co.uk>
Message-ID: <PzU$5EAr5OG3EwWf@g3uda.demon.co.uk>
Source record: 71182

Hello All

First of all this morning I was mulling over the 1999 ARRL Handbook
I alighted on the section relating to transmission lines
etc. Chapter 19.6 and thought I would have a go at making some sense of
the waveform displayed on a Tektronix 1502 cable tester as applied to
antennas.
I had thought that by measuring the height of the reflected
pulse waveform you should be able to get some meaningful ideas about SWR
or loss measurements. Well it is calibrated directly in "p" (rho) or
reflection coefficient) - In fact the "rho" value can only range from 0
through to 1. Simply put, "0" means no reflection or perfect match
whereas p = 1 is max reflection and greatest SWR. That bares out from
the fact that on the 500mp/Div (milli rho) range the rise time value for
open-circuit is 2 divisions [2 x 500mp = 1] which of course is maximum
reflection. Even the initial "step, launch pulse" is 2 division always.
So continuing:

```
1 + |p|
SWR = ------- ...... eqn (1)
1 - |p|
```

The "|" means the magnitude of (its value) and you can soon see that
substituting in eqn (1) for say p = 0 means SWR = 1:1 or p = 1 then SWR
= infinitely high (2/0)!

Now when checking a 2 ele 28Mhz ZL-Special antenna, I can see the
feedpoint (now I have rounded it up to exactly 30m away) and it is a
rising slope (predomimantly Xc) with "p" amplitude of rho = 0.3, so
substituting in (1), SWR at load and discounting resistive cable loss
is:

SWR(load) = 1.3/0.7, = 1.86:1

The Matched Line Loss (ML) for RG8 @ 30Mhz = 0.9dB/100ft x 30m x 3

ML = 0.81dB

Next I find the matched-line ratio, "a" by:

a = 10^(ML/10)

So in this case, a = 10^(0.81/10)

a = 1.205

Now the SWR at the input of the line (SWRin) is always less than
the SWR at the load end (SWRload) because of inherent line losses, thus:

SWRin < SWRload

and a + |P|
SWRin = -------
a - |p|

SWRin = (1.205 + 0.3)/(1.205-0.3)

SWRin = 1.66:1

Its also now possible to calculate the Total Mismatched-Line Loss in
dB's by using:

Tot. Mismatched-Line Loss = 10log x [a^2 - |p|^2 / a(1 - |p|)^2]

So Total loss = 10log[(1.205)^2 - (0.3)^2] / [1.205(1 - 0.3)^2]

Total loss = 10log(1.362/0.59)

Total loss = 10log2.307

Total loss = 3.63dB's

==========

Now all this pre supposes quite a bit!.

* Can the profile of the far-end reflected wave be used for
"rho" for the load?? i.e. the height as measured = "rho"?? The profile
showed a rising profile but then a few other squiggles and a slow decay
away. I can Email anyone a .JPG file of the screen profile if required.

* Can you do this type of test at 28Mhz with a TEK 1502?? or is
it only good at much lower frequencies??

* Am I deluding myself - is antenna tweaking in season? ;-)

Any takers .. please?

I have a UMAX digital camera. It dumps it's images through the serial port, and a supplied cable. It is 800 x 1000 resolution, so does quite well. The software has a function to allow the camera to run in "continuous" mode. A little slower than the webphone type cameras people are using now, but faster than slowscan. :-)

4200. Re: TEK 1502 and antenna measurment?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-17 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <37190D22.9B2F5C5@teleport.com>
Source record: 71185

A TDR system can't be used to determine SWR, unless you have special software which can do an FFT and other massaging of the waveform (which isn't common), or in a few special cases noted below.

TDR is a time-domain system which is inherently broadband in nature. Reflection coefficient rho as used in a TDR system is the fraction of the applied step which is reflected. There's no direct way to translate this into the single-frequency reflection coefficient (variously labeled upper-case gamma or lower-case rho) you need in order to calculate the SWR at a given frequency.

The only times you can make a direct association between the TDR response and the frequency-domain characteristics (without FFT software) is if the discontinuities causing the reflection are known to be purely resistive at least over the bandwidth of the TDR. (An example of this would be a series of low-loss transmission lines of different impedances.) In that case only, the reflection coefficient shown for a discontinuity will be the same in the time and frequency domains. But this will be true only at the specific location along the line where the reflection takes place. With a TDR system you may see several discontinuities at various locations, while a frequency-domain system will give a single value for reflection coefficient. Translation from the time-domain measurement to the frequency-domain value is possible without FFT software, but can be tedious, and again only if all discontinuities are known to be purely resistive.

To all,

Radio Estate Auction for Frank Krantz, Radioman, April 24-25.

I have created an on-line catalog with photos, so you can see what
will be auctioned next Saturday and Sunday. The list is extensive. It
is
split into a Saturday list and a Sunday list. I have included a map and
directions to the auction, which is at Frank Krantz's home in Somerdale,
NJ.

http://www.eht.com/krantz/

Frank Krantz was a Radioman all his life. In the last 25 years he
supplied everyone with tubes, radio parts, radios and you-name-it! He
advertised regularly in Antique Radio Classified and was well-known and
liked among collectors.

He leaves four Daughters who want to sell off everything from his
estate.

Launched a 22.5 foot aluminum homemade antenna this evening with a 36" homemade gamma match clamped to the side of my beams upper masting (about a foot or so above boom). Couldn't even get my SWR's below 3.0:1. What the hell is my problem?

Would it be my gamma match being too small?

Is there a possible grounding problem?

Is my antenna too close to my beam (the possible 18' distance above the beam mounting not done)?

What about ground plane?

What should I use as a ground plane?

Am I seeing a pretty bad Impedance point problem?

>>>Any or all comments will be appreciated.<<<

Vince,

I use a laser printer and tracing paper and always got good results. 10 mil tracks and large copper areas are no problem at all.

The contrast is a lower compared with photographically reproduced exposure masks, however, and so exposure time may be a bit critical (3 min +/- 10 s with my equipment).

And at least my laser printer (LaserJet 5L) shows some "distortion" but this normally causes no problems. With 64 pin connectors for example the spacing of the pins isn't as it schould be but is still good enough for homebrewers.

Thank you for proving my exact point, Bill. The top meter is accurate to 3% of full scale or +/- 1.5 milliamp anywhere over its tested range. It meets this specification perfectly. Yet it is off by 20% [actually by 25% if you more correctly used (Actual - Reading)/Actual as the equation.] So the real accuracy can be quite poor and get worse the lower the reading - and yet remain true to the percent of full scale accuracy statement.

In the case of the second meter, the full scale accuracy is 1%. With only a percent of full scale accuracy statement, this meter must read to within 2 milliamps over its range. Yet at the low end of its scale, the 25 reading, it is off only 1.1 milliamps - much better than its accuracy statement. But again, the true accuracy based on a percent of reading is

over 4 times worse.

I think Bill has misunderstood my point - which is that percent of full scale as the SOLE accuracy statement tells you little about how well the instrument scales at lower readings. He has said that his *NEW* Bird was tested over its range and came out with an excellent report. This is great, and I am pleased for him. But someone else could have an identical model that met the same accuracy statement yet give entirely different results - especially on low readings. I would expect the models would be somewhat reproducible but without additional information, you cannot say for sure. Bill's data illustrates this exactly.

Dear John,
Your Composite Video Signal (CVBS)is interlaced Signal whereas Mointer accepts Non interlace Signal(Progressive Scanning). Therefore the CVBS has to be scan converted . The 9 pin D-plug has five Signals
R,G,B , Hsync & Vsync.
You can use SCan Conveter IC to establish your setup.

I'll provide more informations if you are intrested.
Regards
Murali

Not so fast!

Look at the first meter. At 10 mA the error is 5% and according to the "rule" it should be 18%, if it is a 3% meter. At 20 mA the error is 1.5% and it should be 8.0%. For the second meter at 25 mA the error is 4.2% and it should be 8.0% if it is a 1% meter.

The conventional rule is not functioning very well here because it is too simplistic. If it were, the percentages at lower readings would be much worse. The top reading by itself does not tell the whole story about the accuracy of a particular specimen. Because of small system nonlinearities the % accuracy fluctuates across the scale. It can be pessimistic at full scale, for example. The data for meter #1 suggests this.

D'Arsonval Taut Band Meter folks "try" to maintain the best *average % error* over as much of the scale as they can, despite the conventional interpretation of full scale accuracy. The data shows this, and I have seen it many times.

I repeat: these meters don't just become real poor %-wise at lower scale readings.

More about the Bird wattmeter later.

The problem of how to seperate transmitted and received signals in an FM radio altimeter is not so severe as you may imagine.

In principle, the height information is contained in the phase/frequency difference between transmitted and reflected waves. So the 'demodulator' is essentially a phase discriminator (a balanced mixer) - one input being the reflected signal and the other input being the transmitted signal itself.

As with any other FM receiver amplitude limiters are very effective. And the discriminator itself doesn't care very much about amplitude of its inputs provided they are both above some threshold level.

Frequency sweeping need not be linear. As I described in an earlier posting, a sinewave modulation is used which is more simple for the receiver to process.

Hello Roy

Many thanks for the informative reply. I had a hunch that I was
fooling myself.
Certainly the 1502 is a nice instrument. From what you said

above I guess simple accessment of the characteristic impedance of an unknown coax for example could be deduced by terminating the end of the cable under investigation with a variable pure "R" and watch for the reflections to disappear when you aceive "match" conditions. Then read off the "R" value.

Thanks previously for your hints re probes from the TEK site.
Very useful.

Thanks Roy

... Ken

Wouldn't sinewave modulation produce a sine-modulated difference
frequency?

That is, the apparent height would be a frequency-modulated signal.

This would make it difficult to determine the actual height, since the
detector would have to find the highest beat frequency and convert it to
altitude.

I agree that a saw tooth shaped modulation would be best. Also
there should be a dead time for retrace as you don't want the end
of the sweep mixing with the start as this would give a higher than
correct reading.

If the transmitter is frequency modulated with a sawtooth waveform, the number of harmonics of the modulating frequency is very high and are very strong. The transmitted bandwidth is very, very wide and the receiver needs be un-necessarily wideband to handle it. And how does the phase discriminator cope with it ?

Sawtooth modulation allows easier understanding of the basic principle. But sinewave modulation makes for much more simple receiver AND transmitter design.

Source record: 71208

The modulating frequency must be low enough to handle the time (or phase) difference between transmitted and received signals. Modulating frequency has to be of the same order as the pulse repetition rate in an ordinary radar. The lower the modulating frequency the greater the range of heights. In the particular altimeter I worked on in 1944-45 one of the sinewave modulating frequencies was 400 hertz.

Yes, direct comparison between transmitted and received signals results in a sinewave-modulated difference frequency. But the phase discriminator works not at VHF but at 400 Hz. Very easy to handle. The received signal is demodulated to produce 400 Hz and compared with the actual 400 Hz modulating voltage which drives the loudspeaker-diaphram/tuning-capacitor.

Bear in mind the TX frequency varies both above and below its nominal centre value. It is the PHASE difference, not frequency difference which matters. This is because phase difference is proportional directly to the time delay.

The phase discriminator output is a DC voltage proportional to height. The height indicator itself is actually a moving coil milliameter.

No doubt, these days, for various reasons such as anti-jamming, all kinds of birdie chirps may be used. Other information about the ground can be obtained by using more complex mudulation. But the essential information can be conveyed by the phase-difference between two audio waveforms of the same frequency.

I've forgotten all the other details. And I seem to have gotten present and past tenses mixed up.

I have a 1786 and an AEA Isoloop. They are useable antennas. Great field day antennas. Easy to put up. Narrow bandwidth is no fun. Full wave loop works better. I had a temporary full wave on 20 and it beat the AEA by 10 dB. AEA was not as good as MFJ but easier to tune with the microprocessor tuning box. If you need a limited space antenna, the small loop is your best bet. Try to put up a bigger antenna.

4229. Q:FM TRAP=notch filter??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-18 00:00:00 UTC
From: John Williams <ac6tsXX@n2.net>
Message-ID: <371a5691.0@wagner.n2.net>
Source record: 71214

Tnx for reading.

I am looking for a cheap quick FM broadcast notch filter for a broadbanded FM test receiver. Is a FM TRAP, (the type used for TV's), a 88mhz to 108mhz notch filter? 20-30db attenuation is ok. I know they keep strong FM stations out of WBAM TV. Can I use one to reject these freqs from my wideband FM receiver/scanner? I don't have any test equiptment to build one.

Thanks for any answers
John

National "PW-1" Air Variable Condensor in box. Unit appears to be new, and is in great shape. Looks like it may be a replacement for the HRO series of receiver. Complete with right angle gear drive. Super for that homebrew project, or HRO that you are servicing. Buyer pays shipping. Terms: Bank or certified check only. Thanks!

a typical fm trap as used in the CATV industry is about 85 to 120 mhz,with a "dish shaped" response, that is more rejection toward the middle of the range. You will see a small insertion loss in the desired freq. also, maybe 1-2 db.

>. . .

Yes, that's correct, that method works well. It's best to use a small trimpot to minimize the stray inductance.

You'll get interesting results if you try this method with twinlead, though. I sometimes taught a class in TDR use, and began the class with a little demonstration. (I've described it previously on this newsgroup, so skip it if you've heard it before.) I used two conductors from a ribbon cable, still fused together to make twinlead. One conductor was soldered into the center of an SMA connector and the other to the shell. I connected the SMA to the TDR unit and showed the response. Besides the large step from the open end of the cable, there was a smaller reflected step about 3/4 of the way to the end. Well, I explained, ribbon cable isn't controlled for impedance, so there must be a change in the impedance part way along it. So I pinched the cable with my fingers (causing a reflection from their position), and moved them along until I reached the place where the reflection was occurring, about 3/4 of the way out. Then I got out some wire cutters and cut the wires an inch or so shorter than the place where the reflection came from.

The result: a reflection about 3/4 of the way to the end of the shorter cable. At this point I had the class's undivided attention!

The explanation, I gave as the class progressed, is that I was exciting two propagation modes, differential and common mode (or odd and even modes). The earlier reflection was from the common mode. In this mode, one conductor is both wires in parallel, and the other is the chassis of the instrument and, depending on the time interval, the power cable and eventually the ground. (In this case, the return current was all on the instrument chassis during the time being measured.) The dielectric for this mode is primarily air, so it propagates faster than the differential mode, where the field is largely in the PVC insulation. Consequently, the reflection returns sooner.

Incidentally, you can slide a ferrite core over the wires and suppress the common-mode response, giving a good illustration of balun or common-mode choke operation.

With twinlead, the thing to do is to ignore the early reflection and adjust the trimpot to eliminate the later one coming from the slower differential mode.

The line section in the meter matters too. It isn't just the meter movement
as Bill apparently thinks. The guaranteed specification covers the entire
instrument. The meters are usually better than the spec, they should *all*
be better than the guaranteed spec, but it is the total instrument being
specified, not just the meter movement or its scale. Bird recomends using
a slug matched to the power level you expect to read. That tells me that they
want you to stay away from the lower end of the scale for best accuracy.
That makes sense because diode non-linearity is typically a bigger issue
at the lower end of the scale. This has nothing to do with the meter movement.

No, that is not what Bill apparently thinks, and in the testing of two ancient panel meters I did not suggest that.

The Bird meter looks like a 2% meter, judging by its size and workmanship.

> Bird recomends using
> a slug matched to the power level you expect to read. That tells me that they
> want you to stay away from the lower end of the scale for best accuracy.

In my posts on this subject I have advocated that. I am aware of the diode, but if the 43 is used at strictly 27 degrees or so the calibration should be OK at fairly low levels. Incidentally, there are some "hidden" adjustment pots that they set at the factory.

The Bird 43 has 50 markings. The smallest marking corresponds to 2% of full scale power. This corresponds to 1.33 SWR. They suggest "forget about SWR and just think in terms of forward power and reflected power". If reflected power is "very small" that is usually good enough, they say, except possibly in applications such as TV and certain pulse systems.

If I can't detect "any" reflected power, I don't care what the SWR is. If I really want to know small values of SWR I use a directional coupler (no diodes) and my spectrum analyzer to get the return loss.

The biggest hazards to the 43 are the hammerheads who abuse them.

John
From what I've read of the responses you would be better off with a used
Apple 11 color computer monitor! I use one on a busted vcr (eats tapes)
with computer speakers for sound. The best thing is the Apple uses a
RCA phono jack for the video input and it has a real sharp picture.
Maybe you can find one at a yard sale or trade yours in at a computer
store for what you need!

4236. Confused about tuning circuits: Your insight please?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-18 00:00:00 UTC
From: NOSPAMpfriedr@azstarnet.com
Message-ID: <NOSPAMpfriedr.132.021241F4@azstarnet.com>
Source record: 71221

Hi:

I've been playing with simple receivers for over a year now, starting with crystal sets, and now with regenerative sets based on some old tubes (24's, 26's, 27's etc). What continues to puzzle me is the design of the tuner itself.

In the case of the regenerative sets, for example, I measure my variable cap, compute the "L" needed to get me on the broadcast a.m. band, and a wind the coil. I add a tickler coil, breadboard the thing, and generally, it works as expected.

I have two "antennas" that I use when I experiment. One is probably 15-20' long (stretched across the ceiling of the garage), and the other is probably two or more times that length, and was stretched along the spine of the house in the attic. If I connect either antenna to the LC, the signals are very loud, but tuning seems to be much less selective, and the same station may even appear twice as I sweep the cap. Each antenna causes different anomalies. Clearly, the resonant characteristics of the antennas exert considerable influence on the textbook behavior of the radio's LC.

On the other hand, if I loosely couple the antenna to the LC (2-10 turns wound around the L, connected to antenna and ground), then I seem to get most of the signal strength, while at the same time isolating the LC from most of the influence of the antenna. How many turns should be on the coupling coil? What effect will the inductance of the coupling coil have on tuning?

Now, I've seen several designs for crystal receivers that utilize nothing more than a tapped coil and a detector. How in the world do you design these? Given the impact of the antenna itself, how do you compute an inductance for that coil when you don't know for sure what length of antenna will ultimately be connected to it? Is this trial and error proposition? Where is the C? In the antenna? Parastic C in the coil?

I've read about grid dip meters, and have been told that these could be used to find the natural resonant frequency of the coil but that still seems like an after-the-fact correction vs up-front design. And, it still doesn't help me account for the antenna's influence.

The same tapped coil reappears in regenerative circuits from time to time, but there, it's been called a "loading" coil. If a tapped coil like this is installed in the antenna feed to a regen set, how can I predict how this will affect the calibration of the dial on the cap?

I have several books from the mid 20's to 30's with different radio projects. Given a schematic, it seems that I should be able to calculate the values of all the necessary coils, tapped or otherwise, but I cannot. There is something pivotal that I am overlooking here, because this has all the appearance

of voodoo. Anyone care to attempt a clarification?

Pete

Hello, quick question:

For my qrp station, I think it's still putting out about 5W, what considerations do I need to take into acount for a torriod for making a 1:1 balun? I have some torriods already (T-50-2's, T-68 is the biggest I have I think, and some FT-50 and 37, 61 mix) but I don't know if the power rating is up there. I've never looked at power considerations for torriods, so a quick primer on the subject would be helpful also. Thanks.

Why "should" the error of the first meter at 10mA be 18% or at 20mA
ought the error be 8%, etc.

I think you have totally missed Roy's point. A specification is a
promise of accuracy and not a promise of inaccuracy. If you're
measurements are correct then the observed fact that the meter is
more accurate than the specification at less than FSD is simply proof
that the meter is within its specification and not any sort of proof
that the specification is somehow wrong.

It is theoretically possible to calculate everything ahead of time. The coupling loop and/or tapped coil basically act like a transformer and the impedance of the antenna gets 'transformed' and appears across the LC circuit. If you are using a 'matched' antenna (such as 50 ohms at the frequency of interest) you could design for this. Since you are using an antenna of essentially unknown characteristics the easiest thing, in my opinion, is to do it by trial and error.

You mentioned that you have read books from the 20's and 30's, so you probably have seen that they often used selectable (or sliding) taps on the main coil, or adjust the coupling by varying the position of the coupling coil. The goal is to have 'just the right amount' of coupling to the antenna without degrading performance.

Also, on the Amidon web page, is the correct spelling of the
word Toroid, which you may want to note.

> ought the error be 8%, etc.

If the accuracy is "allowed" to be 3%, then officially it is "allowed" to be 3% of full scale anywhere on the scale.

Example: A 0 to 100 meter is rated at 3% of full scale. This means that at 100 it "can be" 97 to 103, which is 3% of full scale. But that also means that at 20 it "can be" between 17 and 23, which is not 3% but 15%. Or at 10 it "can be" between 7 and 13, which is 30%.

Any worthwhile 3% panel meter that I have ever worked with is a lot better than that.

If a meter *just barely* meets that spec and is no better than that, then as I said, at lower readings the errors "should be" the larger numbers. That statement was correct. The cheaper junk meters do exactly that and no more, so that the meter is not very good except close to full scale.

If you read my writeup more carefully, I am saying that meters in practice are not built that way, and the data that I gave for two old knocked-around meters is a very good example.

> I think you have totally missed Roy's point.

I think you are totally missing my point. The specification is standard practice, but a meter that does nothing more than meet the bare minimum advertised definition of "full scale accuracy" is not one that I would buy if I can find something that goes the extra mile and tries to get a better "average % accuracy" over "most" of the scale. And you may be sure that I can in fact do just that. Read my post again (the part that you deleted from your reply).

The "% of full scale" spec is a tradition, and anyone just barely meeting the spec will not go to jail, but he will not compete with those who do a much better design and test job for the same sell price. I'm not talking about $1000 laboratory things in walnut cases, just ordinary $80 taut band panel meters.

These days an automated test station could take data points (using a computerized optical reader), calculate a linear regression and the standard deviations, min and max errors etc. and possibly tweak the meter mechanism (or reject it) in just 15 seconds. The old traditional "% of full scale" spec is a lousy way to do business since it permits a lousy result.

Actually, I've had quite a bit of luck using solder and an old 240 W
soldering gun. Just be careful not to overheat the cell as you solder.

I've found it helpful to abrade the surfaces of battery tabs with a
Dremel tool, using the edge of a cutting wheel or the flat of a scribing
bit. That way, you can solder to things that otherwise won't take
solder at all. Use a very hot iron or gun and work quickly -- you don't
want to soak a lot of heat into a battery. Probably not a good idea to
do this with the older, explosion-prone lithium cells. 8-O

There is a chain of stores, called "Batteries Plus" around the country.
They might be able to do it for you, since they can rebuild nicad
battery packs in the stores.
There are several stores in Denver, Colorado Springs and Fort Collins
Colorado. They are a nationwide chain, so if you can't find one,
call one of the stores here and ask them where the nearest ont is to you.

Alas, what you have is an EGA monitor. It will not do analog video.
It expects TTL drives. If it were VGA, you'd have a fighting chance
since the analog gun drivers would exist in the monitor (and some
VGA monitors will even accept a composite signal, the Mitsubishi
Diamond Scan does). But EGA monitors don't have any of that.

You could build a color demodulator to separate out the composite
signal into RGB, then build gun drivers to take that and drive the CRT.
But you'd also need to strip out horizontal and vertical sync signals,
convert them to TTL, and apply them to the deflection circuits of
the monitor too. If perchance it is a multisync model (like some NEC
models), you might be Ok. If it isn't, you'll also have to alter the sweep
circuits to handle TV sync and interlace. Basically, you get to build
everything that's in a TV monitor except the HV section.

Sorry the news isn't better. If it were an old CGA monitor, the sweeps
would be compatible, and you'd have an easier time converting it. But
the EGA is neither fish nor fowl, so you're basically screwed.

The AN/PRC-10 range was 38 to 54.9 MHz, with about 1 watt RF output.

The technical manuals for it are:

TM 11-612
TM 11-4065
T.O. 31R2-2PRC-101

I have a 'master copy' of the two TMs in my library.

I use an HP IIp which falls into the "old" catagory. I'm using "PnP Blue", coated mylar that cost about buck a sheet. It will do surface mount (SOIC), but I'd hate to do .025" QSOP packages with it. Doubt it's possible.

Attempts with plain mylar were not so successful. Ditto on paper...it would stick both traces AND the paper backing, which I couldn't seem to get to come off completely even with long soakings in water. It'd be interesting to hear of other's experiences here....may not have hit on the right backing material and right technique. It would sure be nice to find something less expensive than PnP Blue.

Another approach I've resorted to is, if replacing tabbed batteries, to remove the tabs from the old cells and weld them onto the new ones. To do the welding I charged a low inductance 30,000 uF 25 VDC electrolytic, connected it to the tab and the battery case, and pressed the tab to the case. It welded firmly with a bang.

Of course, take the standard precautions, and all that. Good luck!

This is EXACTLY the statement I have been trying to convince Bill of all
along. Change the words in his previous posting and things make much more
sense. [But I still cannot duplicate his numbers exactly.]

>Look at the first meter. At 10 mA the error is 5% and according to the
"rule"
>it should be 18%, if it is a 3% meter. At 20 mA the error is 1.5% and it
>should be 8.0%. For the second meter at 25 mA the error is 4.2% and it
should
>be 8.0% if it is a 1% meter.

The accuracy statement supplied by the manufacturer does not tell you what
the error is at any point. It just sets bounds on the error. A corrected
wording _might_ be:

At 10 mA the actual error is 5%, and according to the manufacturers
accuracy statement, it could be as high as 15%, if it is a 3% of full-scale
meter. At 20 mA the actual error is 1.5% but it could be as high as 7.5%.
For the second mneter at 25 mA, the error is 4.2% but it could be as high
as 8%
based only on the full scale accuracy of 1%.

>Example: A 0 to 100 meter is rated at 3% of full scale. This means that at
100 it
>"can be" 97 to 103, which is 3% of full scale. But that also means that at

No, at lower readings the errors do not _have_ to be larger numbers. But
they _CAN_ be and still meet the full scale specification.

Which was my contention all along...

>Bill W0IYH

There is a small enough amount of data here that it can be done by hand. Taking the first meter, for example, we can either fit the best straight line though the data points, or if we assume the meter was properly zeroed first, we can force our calibration to go through zero. Doing the latter gives:

Predicted_Value = 0.97213 * (Meter_Reading)

Without forcing the calibration to go through zero gives:

Predicted_Value = 0.98537 * (Meter_Reading) + 0.47205

If you look at the errors between these predicted values and the actual values, you will still find the worst error at the 5 mA reading. On the 10, 20, 30, 40 and 50 mA points on the scale, the above equations come to within 2.5% - an excellent meter. But you cannot read into this data that which is not there. Is the meter nonlinear below 10 mA, or is the 5 mA point just a bad reading? You can say only with further testing, not with this data.

But again, with only the 3% of full scale statement to work with, you would never know this. Bill said he had his meter checked against a calibrated Boonton RF voltmeter. So he can say with certainty that his meter is good over the range he checked. Another meter may not be nearly as accurate as his, yet it still meet Bird's 5% of full scale accuracy.

depending on the ferrite type and amount of turns you can figure the
ohms. Not so good when it comes to permeability. The best source is
a ferrite or core manufacturer. Try
Fair-Rite. They should have a web site.

==========
Talking about Lithium batteries ,some time ago I successfully
soldered 2 leads to a pancake type 3V lithium battery , to replace a
memory backup battery with welded tabs in a Packet TNC.

With a 15 W soldering iron ,tinning was fast although the battery
briefly 'sizzled'.
Following installation the battery has performed well for the last 2
years ,eg TNC keeps holding its set parameters.

==========
Recently I successfully soldered leads to a number of Nicad and NiMH
,AA and C size batteries ,this following gentle cleaning with (black)
amaril cloth . The tinning was almost instant with a 15Watts soldering iron.

In order to remove 'chemical debris' from Nicads from a soldering
iron ,bought in 1982, I had to break the welded joint. After
rejoining by soldering these 'oldies' perform well again.
The soldering iron is a US made Wahl Corp. -Isotip (quick charge).
BTW : the 2 Nicads in this soldering iron are charged by AC directly
from a transformer. There is no rectifying diode, just an bare wire
fuse.....I never had seen this before.

I also repaired a Black & Decker hand vacuum cleaner which uses 3 'C'
type Nicads . After soldering the broken weld between 2 batteries ,
the unit is working again as when it was new (8 years ago)

Hope you find the above info useful.

Bob,

We have a franchise here in Fort Myers called Batteries Plus. They have
a spot welding machine for batteries. They have "rebuilt" several of my
battery packs over the years for far less than a new OEM version. If
you have a franchise near you, I'll bet they'd tack them for you.

People keep refering to the meter movements accuracy , I question the slugs, check from one to the next . What good does the meters accuracy mean If my slug reads higher than someone elses slug , I guess now there is now 2 things to consider with regards of accuracy, the meter movement and the slug. Again, either you guys dont own more than one slug of the same value or even different values to really see what a differance there really are between the slugs

I recently received a blower motor (Dayton) . It was in fair shape,
except the
shaft would not turn freely. After taking it apart, I discovered that
it had not been lubricated for eons. It doesn't have bearings on the
shaft,
just a shaft that is oiled. Even the cotton that is supposed
to retain the lubricating oil had just about dissappeared. What should I

use to replace the deteriorating cotton on each end of the shafts? Just
regular cotton, or what? Maybe some sort of felt?

I'm not sure if by "airband" you mean the VHF aircraft frequencies? If so, Ramsey Electronics sells a kit for a 118-136MHz receiver which was featured in a Popular Electronics article a few years back. Their kit is called the "AR-1", sells for US$29.95. Sounds like you don't need the case and knob set, but if you do, that's an extra US$19.95. See the "Receivers and Converters" section of their www page at http://www.ramseyelectronics.com.

If you'd rather work from scratch, I do have the article at home.

>or even different values to really see what a differance there really are
>between the slugs

Right. And the *same* slug can give different readings at different
frequencies within its specified range. The compensation is far
from perfect across the marked range. That same slug will give
different readings again if it is used in a different line section.
The machining of Bird line section castings isn't very tightly
controlled (a small difference in insertion depth of the slug makes
a pretty large difference in the indicated power). Then consider the
nonlinearity of the diode at different power levels, temperature effects,
etc, and you see that there are many potential sources of error. The
meter movement is probably the least of the factors in determining
the instrument's accuracy.

In our shop, we mark slugs to be used with a particular line section
and meter, and make calibration charts for the combination at the
frequencies where they will be used. (We have a Dielectric water
load with flowmeters and temperature probes so we can calculate
actual power and prepare the calibration charts.) That can get us
to about 1% of full scale for the higher power slugs. At low power
levels, uncertainties in flowrate and temperature differential can
lead to a larger percentage error for our calibration setup. So we
try to avoid using the instruments near the low end of a power
range.

> old knocked-around meters is a very good example.

Hi, Everyone,

Could Mr. Lewallen and Mr. Sabin both be correct? They could if they were talking about two different things.

The difference between them is that one is talking about "worst case spec" and the other is discussing "typical performance".

Lots of test equipment is specified by a single number, regardless of range, input level, noise floor, and all the other factors that influence the measurement. Like the Bird 43's "5% of full scale" spec.

Persons using these meters know that, if they want to do an error analysis of the measurement, using that "5%" spec takes into account the worst *possible* uncertainty. They can be absolutely sure that the device under test does meet its specs, because they've taken into account the measurement system's worst-case errors and are assured that, no matter what, their measurement includes enough of a safety factor to pass a good unit.

(Some good units will be failed because of this, but no bad units will be passed. It's the tradeoff that needs to be made if you value the integrity of your measurements.)

> The old traditional "% of full scale" spec is a lousy way to do
> business since it permits a lousy result.

Is it a lousy way to do business? Maybe so. If I worked for Bird, and I knew that the typical Model 43 was way better than that "5% of full scale" number at different points on the scale, why wouldn't I want to do a more careful calibration to tighten up the spec? This is a question I'm always asking my customers. The varied answers I get include:

"We like to spec it like that. It's part of our mystique."
"We don't want to spend the money for that test system right now."
"We don't need to spec any more tightly than we do."
"Our customers know that's a very conservative spec."
"We have our own calibration method. We don't want to have to re-train everybody."
"Why should we?"
"Maybe later."

R,

Al

And you still do not understand what I am trying to tell you.

One more (and last) time. I am really sick and tired of this.

I am saying that a meter that just barely meets the full scale % (aka the Roy meter) is "allowed" to be a very poor meter %-wise at below full scale. The meter that I will buy is the one that is 3% of full scale, but designed so that the degradation of % accuracy is smaller than what the Roy meter tolerates. I *know* that I can buy such a 3% meter for the same price. In other words the % error across the scale is the thing that anyone in his right mind is going to shop for and compare.

"How well does the meter track across the scale?" This is the most sensible question that I can think of. When I evaluate a meter it is the FIRST thing that I look for. And if I compare brands X,Y and Z 3%-rated $80 meters, guess which one I will buy.

This preoccupation with the literal interpretation of "% of f.s." that is used in catalogs is not necessary. I think it is a lousy way to do business and vendors do it to make life simpler and less litigious for themselves (who can blame them?). But they can, and do, perform better than that, they just don't commit to it.

If you understand this simple message then you understand my point exactly. I have no interest whatsoever in the strictly legal "Roy meter". A meter that is off by +/- 3 units at a reading of 10% of f.s., or even +/- 3 units at 20% of f.s., is not desirable. I will not buy it and I do not have to. Instead of haggling about numbers to 4 decimal places, let's use some common sense.

The message is clear and simple. Why is there so much trouble with it?

I do not want to argue about this any more. If you nice (and one or two not so nice) folks out there think that I am "mind set", then so be it. I will believe

what I think makes sense and let it go at that.

At this point in time the discussion is centered on the actual 0 to 30 uA DC meter itself and not on the Bird wattmeter. The meter itself has interesting problems of its own.

The Bird 43 is rated at 5% of full scale. The meter itself is probably a 2% meter. The other 3% includes the element and the built-in coaxial assembly. The 43 construction is "precision" as nearly as I can tell by looking.

As for the elements, my *new* 250H and 1000H for the 2-30 MHz range are *very good* (within a couple of tenths of a dB) in my *new* 43.

Hi Pete,
I would first recommend that you get a copy of the ARRL handbook,
(radio amateur handbook)
it is loaded with info that you will find helpful.

>>If I connect either antenna to the LC, the signals are
>> very loud, but tuning seems to be much less selective,

There is characteristic called Q (quality factor), it is expressed a
couple of ways. One is the Q equals reactance of the coil in
ohms divided by the resistance of the coil. Q = Xl / R
Note R of the coil is not as simple as the DC resistance,
it altered by the skin effect, dielectric losses and core losses
(if a core is used)
The other is, the resonant frequency divided by the difference
between the 3db bandwidth points equals Q.
Now, when you put a load on the coil it is like increasing the R
of the coil. The load can come from the input (antenna) or the
circuit the coil is driving (the detector and headset).
If you have a low Q you will have low selectivity and high Q
will give you a good selectivity.
When you loosely couple your antenna to the coil, it loads
the coil less and gives you better selectivity.

I tried to address that a while back. The Bird 43 is a field
instrument, not a lab instrument. It must work over a very large
tempature range. Not only is the meter movement in questiion, but
also the components in the slug and mechanical accuracy of the
sampling line secment. You always have to allow for the worst case,
which migh only show up as 1 in 1000 while the others are much
closer, especially under more controlled enviroments.

I just did a brief search of some old books and I turned up nothing.
However, Ohmite made a series of RF chokes using that numbering. For
instance the Z-50 was meant for 6meter use, and the Z-144 was intended for
use in 2Meter circuits. So whatever value the Z-28 is, it must be
sufficient inductance for use around 28MHz.

A 1961 Handbook had an Ohmite ad, and a line about the chokes, but no
data. I checked a couple of old VHF books, and nothing there either.
It's the sort of thing that might have turned up in a Hints & Kinks
column, but nothing specific comes to mind other than a vague feeling that
I have seen such information somewhere.

As long as it is being used as an RF choke, the exact value probably isn't
particularly important. A choke is really just an inductor.

The ARRL Radio Amateur's VHF Manual (I have the last two editions and the
piece is in both) had a bit about RF chokes for VHF and UHF use. It gives
some detail about using them, and winding them, and gives a chart with
winding info and inductance:
50MHz 7.8uH to 9.5uH
144MHz 1.4uH to 2.2uH
220MHz 0.5uH to 0.75uH

So one might assume something like 15 to 20uH would be suitable at 28MHz.

Of course, a lot of all band transmitters were built with 1mH or 2.5mH
RF chokes.

Ohmite Frequency Inductance Core Dimensions
Number Range, MHz Microhenries inches
Z-400 320 - 520 0.20 1/8 long, 5/32 dia
Z-235 160 - 350 0.84 3/4 long, 3/16 dia
Z-144 80 - 200 1.8 3/4 long, 5/16 dia
Z-50 35 - 110 7.0 1 long, 9/32 dia
Z-28 20 - 60 21.0 1-3/4 long, 5/16 dia
Z-14 7 - 35 44.0 2 long, 7/16 dia
Z-7 3 - 20 84.0 6 long, 9/16 dia

The Z-7, Z-14, and Z-28 are wound on a ceramic tube. Those for higher
frequencies are wound on plastic formers.

I'm fixing a radio for a friend and need to locate a couple of transistors. The 2sc2954 and the 3sk131. The usual generic places (Mouser, JDR, Digikey, MCM) don't carry these RF transistors and there is no SK or ECG cross for them. RF Parts has them, but they also have a $25.00 minimum. Any help for a source would be appreciated!

Thanks and 73,
Joe ka0yos

Thank you very much Allan,

this answer saved me some research ;-). The mistake which I made was indeed to try to model noisy oscillator signal as a pure sine wave with linearly superimposed frequency dependent noise. I should have realised, that it is not the case. Now it sounds obvious: If the oscillator is noisy (phase), it cannot be modelled as an infinitely narrow spectrum line with whatever added to it.

I'm busy with an home made synthesiser (70 to 100MHz, 10Hz step) for a
future decametric TRX. I need a prescaler for the last PLL loop. Visiting
one of my local dealer I've found a U664 (divider by 64). Unfortunately,
this chip isn't cased in the usual 8 pins DIL case. It uses a 6 pins SIL
case I never saw before (at least for the U664).
Does anybody know the pinout of this U664 (6 pins SIL)?

Thank you in advance.

Hello--

That's a difficult question to answer-- it depends on ripple current, ambient temperature, and how well the capacitor was manufactured to begin with.

I'd guess at a five- to ten-year lifespan (maybe longer, depending on how often you use the equipmen73,

[Snipped]

Hello Roy

Now I have learned something there. I have even tried out the
experiment. Yes its fascinating to watch the "magic" of it.

Going back to my earlier wrong notion! of being able to eek out
meaningful antenna measurements, I have found a old TEK application
notes at work (AX-3241-1) which has a section entitled
"Component/Antenna Testing" but really it only suggests that profiles of
original correct antennas setups be printed out on the chart recorder
and then if there is a future problem you can at least compare "faulty"
profile with the original. It does make the statement however in
relation to interpretation of an antenna signature:

" ... may not be a simple one and it may be quite difficult to
evaluate it analytically. That is to say unless one is clever, it is
difficult to look at a "bump" on a TDR signature and state. "Oh yes. The
third dipole of that antenna is 2.7 inches too long" ... It then says:

"NOTE: An expert can make such statements". Must be a strange array
(Koomans! having a 3rd dipole ;-)

So this certainly backs up all you state Roy. Its darned interesting stuff. Probably knowing the step time, amplitude and relating it back to a set of Fourier series tables a bit more could be revealed but its messy and certainly was never intended to be used in this way.

BTW I have used TDR's for checking center-conductor brazes on coax routes as well as locating "split" pairs, diss'es & shunt faults. We always required two TDR types generally for the copper network, one for short-range up to the loading coil and another instrument that could "look" through "loaders"

Anyway - an interesting experiment and thanks for your time and expertise Roy.

Doug OM,

I am using several in various rigs, which are 1956 and older manufacture dates. All original caps in two DX-100B'S for example. Also several in various power supplies that I have, 450 V caps, at least 40 years old. I recently fired up an SB-220 Heathkit amp that had sat unused for maybe a decade or more; all electrolytic caps were OK. The lifespan of electrolytic caps is determined by the evaporation rate of the electrolyte. This is calculated using the Ahrrenious (sp?) equation, which is a standard chemical equation used to relate evaporation rates to vapor pressure and temperature (I think). The temperature of the cap is dependent on the environmental temp where it is located in a cabinet, as well as the ripple current and equivalent series resistance (ESR), which causes I^2R losses in the cap. If you want complete info, just contact any of the major capacitor manufacturer's engineers. They can supply you with more complete information. The info may even be on one of their web pages. Have you looked?

73,
Don, W6JL

Hops are Styrian Goldings, all the way through.

Grain bill goes something like this (this is a distillation to 5 gallons
from the actual recipe page at the brewery, BTW):

Pale malt, 70%
Crystal 60, 20%
Wheat malt, 7%
roast barley, 3%

OG about 1.044

30 min @ 145F
30 min @ 155F

10 min. mashout

The hop bill I never got scaled dow correctly. For a 50bbl batch, it was
7 lbs. in the kettle, and 44 lbs. in the whirlpool.

Try about an ounce and a half, maybe two in the kettle, 4 or 5 ounces as a
late addition, like 5 minutes before the end of the boil.

Or steep the whole mess while the beer is chilling.

Good Luck!

Message-ID: <01be8c85$ce2f54e0$6be6abc3@default>
Source record: 70992

To predict the reliability of complex electronic equipment
designers refer to tables of the reliability of individual
components. Reliability is measured in terms of MTBF =
Mean Time Between Failures.

For example the reliability of an electrolytic capacitor
might be stated as MTBF = 100,000 hours. A 100-watt
light bulb may have MTBF = 5000 hours. A 100-ohm 0.5
watt resistor MTBF = 500,000 hours, etc.

IEEE and IEE will certainly know where such tables may be
obtained. The likelihood of failure of space missions are
predicted from such tables, the reliability of every
individual component being taken into account. The tables
are kept to date and data amended to into account latest
reports from the field or from laboratory accelerated life
tests.

It is tough to get good phase-noise performance from a single VCO with such a broad tuning range. You should consider breaking the problem down to use several discrete VCOs. Also look at how commercial analyzers work: typically there is a YIG oscillator running from 2-4 GHz with a correspondingly-high (2 GHz or so) first IF. The YIG is driven by a low-noise op amp (e.g. an OP27 or similar-grade part followed by one or more power transistors and temperature-stable power resistors for V->I conversion), with carefully filtered control lines.

The good news is that once you have a wide-range local oscillator working cleanly, you'll find all the rest of the R&D in your project trivial by comparison. :)

Honker's comes in at 38 IBU. With the ratio you presented, it's about
14% of the total hop bill for the boil and 86% at the end.

Assuming a five gallon batch size and 5% aa Styrians, that's about 2
ounces for the boil and a whopping 12 ounces at the end. Ouch!

Here's the formula I used (from the article in BT) for the first hop
addition:

Weight of hops= IBU * Batch Size / Alpha Acids * 7490 * Utilization

Wtith these givens:

IBU = 38
Batch Size = 5 gallons
A.A. = 5%
Utilization factor = 26%

Hope this helps.

-Bryan

just because caps have old date codes and "still work" doesnt mean they won't fail. i replaced the filter caps in my HP-608 sig generator with Xicon units (from Mouser). the old filter caps have dte codes from 1957. i noticed 60 Hz hum on the RF signal, and decided to replace **all** the filter caps. no more hum on the signal.

the newer metal can electrolytics can last some 10+ years. the older monster-sized electrolytics had a much thicker dielectric. to accomodate the thicker dielectric, the caps had to be made bigger. they lasted for decades but now no one manufactures them.

For Sale;
New in the original box- National Velvet Vernier Dial model ICN. This looks like a VFO dial with the Blank paper to write your frequencies on for your homebrew transmitter or receiver. It is complete with hardware and dial lights. It looks like the half round type, not rectangular. It is similar in size and looks to a Johnson transmitter VFO dial (ranger, valiant) except it is black.
$50 shipped cont. U.S.

These are voice multiplex sideband filters, carrier frequencies 76 and 92kHz respectively.

I have had some success (And some surprises) measuring it with a selective voltmeter and a good quality high value capacitor to block the DC . A Mylar with several uFarads and suitable voltage rating seems to do pretty well. Set the voltmeter to a narrow bandwidth and measure down close to the limiting bandwidth of the filter in use. In the case of the 3 terminal regulators, even decoupled as recommended, it gets pretty bad. Particularly around 10-15 KHz. A well bypassed 723 is VERY much an improvement, and unfortunately, the old Motorola 1566 (No longer manufactured) was the best of the lot!

JohnsonHE wrote:
>Used to be a rule of thumb that you cut
>the life in half for every 10 degree Centigrade rise in operating temperature.

It still is. It's also a function of ripple current, which determines the internal temperature rise above the outside ambient temperature.

These figures are for the Panasonic TS-UP series of capacitors. So-called "long life" capacitors should do better, but the *relative* trends of life vs temperature vs ripple are probably very similar.

Temperature %ripple[1] Expected life (thousands of hours)
deg C

+45 0 45
+45 100 25
+65 0 11
+65 100 7.5
+85 0 3
+85 100 2 [2]

[1] %ripple = (actual ripple current) / (specified max ripple current at 85C)

[2] 2000 hours is the specified minimum expected life at the maximum rated temperature and ripple current.

Comparing 0%-0%-0% or 100%-100%-100%, the expected lifetime decreases to approximately one-quarter for every 20C rise in external temperature, which is pretty close to one-half per 10C.

An ordinary scope (as someone else suggested) is not really useful for looking at noise voltages at these levels. I've resorted to simply using the power supply in question to drive the tuning line of a VCO, looking at the VCO output in a narrow RBW on a spectrum analyzer. That will give you an idea of the worst-case power supply contribution to phase noise.

You can take the VCO's own phase noise into consideration by temporarily adding a massive RLC filter to the tuning line (choke and resistor feeding a 10 uF/.1uF/100 pF combo...), or by replacing the power supply with a 9V battery. Although on the latter point, I have heard some people claim that batteries are not as "quiet" as you would think. I don't think I've ever noticed any excess noise from batteries, so... YMMV.

In my (limited) experience, the pecking order of power-supply noise looks like this:

- 78xx 3-terminal regulator (worst)

- Bypassed zener diode alone (MUCH better than 78xx any day of the week)

- Bypassed zener diode with OP27 or similar voltage follower

- 723 voltage regulator

- 9V battery (RC filtered for paranoia's sake)

The last three are, or at least can be, about the same. I'd be curious myself to hear any other perspectives or corrections -- this stuff can get weird.

From Jack
In addition to www.microchip.com, get a copy of Circuit Cellar Ink and look at the various suppliers of PIC and STAMP variants, with their assorted programmers. You might also want to attend one of their seminars - you get a discounted rate on a programmer, all the software, and a 16C84 (I think) to play with. These people are pretty user friendly.

They are pretty quiet, though. If I recall, we used a lead-acid battery as a final filter on a power supply in solid-state physics lab many years ago.

I am considering the purchase of a "Brute" model
HF amp for conversion to 6 meters. It runs a pair
of MRF 412's.

The MRF 412 does not appear on the Motorola
on-line specifications site.

Is this device suitable for all-mode use to 150 watts
or better (as a pair with 10-15 watts drive) on 6m?

Thanks! & 73,

Many of the semiconductor companies have on-line data books. In fact, the paper data book, that many distributors used to give away, are becoming a thing of the past.

If you know who made them, check on their web site. I am not sure, but the MV1662 sounds like a Motorola number.

Source record: 70999

Further to my last posting.

In tables of reliability of electronic components,
reliabilty may also be stated in terms of Failure Rates.

Because failure rates are very small they may be recorded
as Failures per 10^9 hours.

10^9 hours = 114,000 years.

MTBF = 1 / (Failure Rate)

To combine the effect of many different components, simply
sum the individual component failure rates. Components may
include hand soldered joints or flow-soldered joints in
printed circuit boards, nuts, bolts, screws, etc.

Overall equipment Mean Time Between Failures = MTBF = 1
/ (Sum of all Failure Rates).

>>of Usenet for me.
>>
We are in the Ham Radio Business and have been for several years.
The ham business has really declined since the internet became popular.
We are going to clear some stock on ebay.
The intent is to auction off items on a regular basis ie: each week
I have placed some announcements on the ham groups like this>

<<Audio Booster for your HT
We intend to auction off at least one each week on ebay
www.ebay.com
search for "audio booster"
hve fun bidding
73>>

So far we have about 15 happy hams and more each week as they
are getting these at about half price.

Other items are:

440 whip antennas
boom mics on a headset
35 watt HT linears
earbud and ptt mike for Icom HT's

The URL of course changes for each new listing so the search is required to
find each new listing.

Is this inappropriate or a service to the group?

4343. Re: PC boards and laser printers

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-22 00:00:00 UTC
From: Vincent Coppola <vinyc@snet.net>
Message-ID: <371EC813.8B7@snet.net>
Source record: 71008

These are the type of answers I was looking for, and much appreciated. A little background on my interests: I am an experimenter/hacker just trying to make my own PC boards for various projects. At first I tried the direct plotting to copper, as described in a recent QST article, using STAEBLER Pens. I designed some microstrip filters in the 2.4 ghz range using PUFF and sending the output to an old HP7475 plotter. With those small boards,and the accuracy of the plotter, the results were excellant. The filters worked very close to design. But in a more recent project, I designed a much larger board using a PIC microcontroller and some digital IC's, and believe me the direct plot method was more trouble than it was worth. By the time I fixed all of the dropouts with solder jumpers, it would have been much more simpler to just wire-wrap the board and be done with it.

So this has prompted me to look for "a better way", and that was the laser route. A walk through the local retailer showed three varieties...the $399, the $499, and the deluxe $699. Which is the right one for making PC boards? Or do I just look for an older unit in the used market? So your answers have helped.

So many thanks for the responses.

I suspect that even the cheapest will do a fine job if you keep the copper clean. I use PnP Blue, used to use the clear equivalent, and a Laserjet 3. Been making VERY complex boards and even the 0.005 inch lands will carry current.

The higher resolution of the newer printers should bode well for the TSSIOP packages although I've been doing the 0.05 inch layouts and no troubles with the 300 DPI.

<snip>

If you're going to spend $700 for a printer that'll be used only for PC boards, you might want to seriously consider using a board house such as Alberta Printed Circuits. For $76.00 US they'll make you a 40 square inch, double-sided drilled (with plated-through holes) board. They provide free copies of EasyTrax and GC-Prevue software for laying out the board and checking the results. Turnaround time is 2 days. And the quality of workmanship is awesome. I've used them for both through-hole and surface mount (the latter with 7-mil traces and 8 mil spacing). Their web page is http://www.apcircuits.com .

I realize that the economics of all this is variable - that for the price of 9 board submissions you also end up with a deluxe laser printer. But if you don't need that printer for anything else and only do 1 or 2 boards per year, this could be much more cost effective. For what it's worth, I have a laser printer AND use AP Circuits, mostly for quality reasons (hole positions and plating).

Styrians is what I was after. I can play with the hopping over a couple of batches and try to tweak it to my taste. Does anybody know if dry hopping is an option for this recipe (versus my own taste). I am personally not 100% comfortable with dry hopping because of the increased chances of infection. However, I have tasted a few brews where dry hopping makes a great beer.

Is there any solid research that indicates how much dry hopping increases the chance of infection? My own anecdotal evidence (i.e., not-scientifically rigorous experience) suggests dry hopping has no effect on infection rate.

Hello--

OTOH, I've encountered leaky surface-mounted aluminum electrolytics
that are only a couple of years old. That portends ill for future
collectors interested in primitive Pentium-class PCs and accessories<g>.

Older-technology capacitors are physically larger, contain more
electrolyte, and have thicker plate separators and seals. I, too
have seen 60-year-old electrolytics that still maintained capacity
and worked fine.

I'm looking to make a repeater out of two old Alinco DR130T mobiles I have sitting around. I know it's theoretically possible to do this without any internal mods to the units, but how? I've thought of rigging a VOX circuit to the output on one radio to the mic feed of the other, but need more specifics. I already have two ringo antennas set approx 50 feet apart to eliminate crosstalk probs without a duplexer and installed a tone board on the "receive" radio. Now how do i get this VOX circuit to work with the two radios, or is there some type of controller I can buy pre-configured?

ANY HELP WOULD BE GREATLY APPRECIATED!!!

You'd better take a look at the newsgroups this was posted to. Apart from the issue of whether forsale ads are welcome in a given group, cross-posting greatly increases the problem.

rec.radio.amateur.homebrew is not about buying and selling. It's for discussion of building your own radio equipment. There's been a tiny bit of debate about whether forsale ads should be allowed, but the pivot point is over whether on-topic items (ie components and perhaps related test equipment) should be allowed, not over whether any ads should be welcome.

rec.radio.amateur.boatanchors was set up to discuss the old stuff. I remember the debate when it was created about whether forsale ads should be allowed, and eventually it was decided that they would be allowed, but only in a secondary fashion. In other words, a few ads would be okay, but it wasn't the primary purpose of the newsgroup.

Sadly, ads do tend to dominate the group. I sincerely question what kind of hobby it is that people are more interested in buying and selling the stuff than talking about it, because that old equipment is interesting enough to have plenty to talk about. I'd be less bothered by the forsale ads if people took the time when selling something to say something about the equipment they have for sale, both technical and their own relationship to it, and take the time to look up reviews of the equipment and references to finding the ads for when the equipment was new. But that doesn't happen becuase people seem more interested in selling the stuff, and it appears in a fair number of cases the people don't even know anything much about the equipment they are selling, other than that it's "rare".

rec.radio.amateur.equipment was never intended for the sale of equipment. It was intended to discuss it. I rarely look in there nowadays becuse ads dominate.

The problem with letting any ads in is that more ads will follow. Someone sees an ad from someone else, and they decide it's okay to do so and then they do. What might start off as being a handful of appropriate forsale ads, if you accept forsale ads in the first place, becomes a flood of ads

and then the un-related items start getting forsale ads in that newsgroup.

Nowadays in rec.radio.amateur.homebrew we are seeing a steady increase in forsale ads. Most of the ads are not selling components for us to build with. It's commercially built equipment. Some of it arrives through the wonders of cross-posting, but I've noticed a fair amount of it being posted only in rec.radio.amateur.homebrew (or perhpas the person is posting to other newsgroups but one at a time).

But it doesn't stop there. Once the ads are happening, then people decide to sell off their other stuff. So you see ads for computers in the ham radio newsgroups. Then you see people selling their audio equipment. One of these days someone will try to sell their kitchen sink.

The debate keeps pivoting on ebay, as if ebay is particularly worse than someone selling something here, rather than announcing here that they are selling something elsewhere. In reality, there is very little difference. They are both just as troubling.

An important thing to keep in mind is that readership is not limited to the US. Maybe people there are willing to buy and sell across the country to people they've never met, but once you cross borders the problems increase. I don't think anything would tempt me to order outside the country from an individual. Yet as the ads increase, those of us not in the US have to put up with stuff that is not only not particularly on-topic, but has no relevance to us. If you want to drive the non-US participants away, just keep posting forsale ads and forget about discussion.

Largely a heat problem, the larger physical size is a help in dissipating that heat. One other consideration, is the heat generated from the ripple current, and this is much greater in the case of a solid state rectifier than it is in a high vacuum rectifier. (Mercury vapor 866's are something else, but they didn't often use electrolytics with those.) Used to be a rule of thumb that you cut the life in half for every 10 degree Centigrade rise in operating temperature.

True, but I reckoned that as the question was being asked in this
group that the person was interested in 40/50 year old gear,

and:-

>> Largely a heat problem, the larger physical size is a help in dissipating that
heat. One other consideration, is the heat generated from the ripple current,
and this is much greater in the case of a solid state rectifier than it is in a
high vacuum rectifier.

one big difference is that voltage rises fairly slowly in a tube
rectifier as the electrons get working. Solid state diodes hit max
virtually straight away. Could this have a bearing on the life??

Glen.

Source record: 71024

One point that hasn't been mentioned here is that the voltage-handling ability of electrolytic capacitors declines if they're stored for long periods without use. So a capacitor might be bad after long storage, but can be brought back to life.

The insulator is a coating which is plated onto one of the electrodes by an electroplating process. This process naturally occurs due to the applied voltage when the capacitor is in use. When stored for long periods, the coating deteriorates and must be re-formed to restore the capacitor to its original voltage rating. (An associated problem is that when in use, the dielectric coating will, over a long period, naturally degrade to match the applied voltage. So if changes are made in the circuit which raise the capacitor voltage, say by replacing an old rectifier tube, the capacitor can leak or explode due to the suddenly increased leakage current.)

An electrolytic capacitor is re-formed by applying a voltage through a current-limiting resistor. The voltage is slowly increased until the leakage current reaches some specified value, then left at that level until the leakage drops to a low value as the dielectric layer forms. Then the voltage is increased until the leakage current again increases to the limit and left at that value for forming, and so forth, until the leakage is adequately low at the rated voltage.

There are various rules of thumb for how large a leakage current can be tolerated during re-forming. One reference I have for modern capacitors gives 5 mA for small PC-board-mount capacitors, and 10 mA for large computer grade capacitors. It seems to me the important thing is to limit the temperature rise, so the tolerable current would really be a function of capacitor size and the voltage across it. A quick look at the _ARRL Handbook_ index didn't reveal anything about this topic, but I know it was in the Handbook many years ago. The folks on the .boatanchors newsgroup should be able to provide a lot more practical information on the topic for those who are interested.

Larry OM,

Please observe, I did not say that the older caps would not fail eventually. I only said that they had not failed YET. New capacitors will certainly fail eventually also, and perhaps sooner than the older ones time-wise, for the reason you mentioned. This is another case where newer is not necessarily better (I observe this to be true in many areas), since in this case the design emphasis has been put on minimizing capacitor volume instead of electrolyte thickness (and long life?).

4362. Measuring noise on DC power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-22 00:00:00 UTC
From: owens@ale.atd.ucar.edu
Message-ID: <7fnstn$5j0$1@ncar.ucar.edu>
Source record: 71027

Can someone suggest a method for measuring microvolt level noise
on DC power supply lines? Is this a direct measurement? or is
there an indirect method of doing this?

Since the noise on the supply line of a vco will cause additional
noise in the vco rf output spectrum it would be convenient to be
able to measure this noise separately before the supply is connected
to the vco.

Some of the new LDO regulators designed for the "wireless" market
are claiming very low levels of noise on the output. I'd like to be able
to measure this noise directly-if possible-or indirectly if that is
more practical.

>\ ~ / .... DavidC K1YP@qsl.net

The MRF412 was specified by Motorola to run 70 watts PEP at 30 MHz (each).
There are no performance curves or impedance curves above 30 MHz.

At 30 MHz, they were stated to have a *minimum* gain of 13 dB at the rated 70
watt power output. So, a single one needed about 14 watts drive - two would
have needed at least 28 watts drive, plus the loss of the dividing / combining
network. The gain appears to fall off at 2dB per octave in the rated range.

Given that you are looking to run two of them at nearly twice the rated
frequency (gain will decrease), the answer is no, they will probably not give
you the power output you specify at the frequency you want to run with the
drive you have available, based on the *guaranteed minimum* specs.

>diodes?
>
>Thanks in advance!
>
>Lee Jarvis - KN4VN
>

Yes. I knew there was some reason I'd kept my Motorola parts manuals for 20 years.

For the MV1662, the rated specs are at Vr of 4.0 volts, C is 225pfd minimum, 250 pfd nominal, 275 pfd maximum. Capacitance ratio C2/C15 is 2.3; Q is 150 at Vr 4 volts and 20 MHz. Series inductance is 5 nH. Vr max is 15 volts.

At 10 volts, it looks to have about 150 pfd capacitance, looking at the graph, and maybe 120 at 15V. This is in agreement with the ratio shown above.

I may have the info on the BB104 also, but it is not as easy to recover.

While it is possiable to do this using a VOX circuit, most repeaters
will use the squelch circuit signal. I have seen some VOX stuff
advertised, but never looked at it. Besure you allow for somekind
of identification circuit and control circuits to shut the thing
down if ther is a malfunction also to stay legal. There are several
controllers made that will do this. Probably a beter way to go is
to look for a GE Mastr II comercial radio , mobile unit that can be
found for about $ 50 and recrystal it for about $ 50. Then look at
the CAT-500 controller for about $ 200-300.

www.catauto.com

I have been using this combianion of variation for about 10 years,
started with another controller.

Also look at www.nhrc.net for a simple controller that will plug
in the
Mastr II for about $ 160.

The Alincos probably will not be selective enough to work very well
as a repeater receiver, and the transmitter will probably not be
clean enough either to keep from desenseing the receiver. I doubt
that they are shielded very well either.

I doube that 50 feet will be enough seperation for the ringos
without some cavities for filtering. Besure you use some very good
grade of double shileded coax or hardling. The 9913 type of stuff
may work.
The ringos have a bad habit of not isolating the antenna from the
feedline and that can also cause some problems.

There is a lot more work than it seems like to get a repeater
working very well.. I have been keeping 2 on the air for about the
last 20 years.
They can be lots of fun, but lots of agervation too.

Brian,

I think Roger, N0YOX has answered this recently. He has a repeater controller based on the Basic Stamp module. Make sure in any installation, you have at minimum, a 10 minute CW ider, and ability to cut transmit remotely, in case things get out of hand.

I'm curious how you have those antennas spaced to avoid having to use a duplexer? Is the 50 foot separation vertical? You might find that separating them on the same mast might be easier than horizontal separation, especially if you limit your output power. The Ringo, (original?) has a null overhead, so even 15 foot separation might work.

Look at Roger's site: http://www.iland.net/~n0yox/n0yox.html

Hey, has anyone done any mods on the Ten Tec 1340 40m transciever? No,
I'm not looking for out of band tx mods. Just what others have done to
their radios, or other Ten Tec QRP line of radios. I've heard of
putting in a multi turn pot for the frequency control, and the
instruction manual talks of putting in the keyer module into the radio;
I'm just looking to for details of what others have done. Thanks.

Hello Michael -- the Standard home page with a dealer listing is at URL:
http://www.stdradio.com/

For mods -- maybe search the mods listings at URL:
http://www.ac6v.com/pageA.html#MODS

Good Luck

Hi Tom -- wrong newsgroup -- try the T I L E . N E T page for possible
pertinent beer news groups (12 to choose from) at URL:
http://tile.net/lists/

For Amateur Radio Operators -- we take 2 mellow 807's -- place them on a
BoatAnchor for two days -- stir every 4 hours.

And every Ham's YL or XYL knows what an 807 really is!!!!

I've got those babys perched on the mechanical room atop a 12 story hotel building, about 150ft elevation, horiz. spacing... This is the repeater location for all public safety in the county. I've talked to the police department on my 50 watt mobile from approx. 85 miles from the tower site!!!

One more thing....I must thank everyone for the reponse to this post. I get no less than 10 emails a day with suggestions on this topic. Thanks guys, y'all are great!!!

I was wondering about the application too. If it's for a certain range, one old trick was to put a signal into the middle of the range and modulate it with 100KHz or 10KHz or whatever frequency. On either side of the main signal there will be signals spaced the modulating frequency apart. By starting with the centre frequency you wouldn't have to worry about the harmonics of the low frequency signal dropping off by the time it reaches that frequency, but you'd still get the closely spaced signals that you wouldn't get if you started with a higher frequency.

One specific application comes to mind, wanting markers in the 2Meter band. So you start off with a 146MHz signal (start with a lower frequency and multiply up) and then modulate it with 30KHz to get markers on the FM channels.

Of course, this is less of a useful scheme if someone is looking for markers over a very wide range of frequencies.

Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Howdy Dave.....I too didn't find the MRF412 specs but came up with some ballpark figures based on cross reference to either the NTE317 or ECG317 for the MRF412 and to the ECG334 for a MRF412A

NPN-Si, RF Pwr Output (Po 70W, 30Mhz) BVcbo 36
BVceo 36
BVebo 4
ICmax 15 amps
PDmax 220 watts
Hfe 10 minimum
Case RF-50F

The '334 is a little lighter rated at 60W 14-30Mhz and 175 watts PDmax with same Hfe of 10......Case is a RF-38S

I looked the MRF412 up in my Motorola RF devices manuals (all volumes) and you're right it doesn't show so is likely made by someone else (or is newer than my books).

Hope this helps a little......I'd guess that for 50 Mhz operation you'd likely have to settle for a lot less gain....might not be in the desired power output range you are looking for.

73 - Keep on Tinkering.....THAT....is REAL HAM RADIO!

MRF412 from RF parts book:

1.5 to 30 MHz HF/SSB
Power out 70 watts
Power in, 1.6 watts
Gain in db @ 30 MHz, 16
Package 211-11

They also have them available for about $25.

Yes, I do.
I thought about stopping there as the content of the answer matches
the content of the question...none.

People would be able to give you a much more direct answer if you
gave the slightest clue about what characteristics you wanted.

A blind suggestion is to think snap diode and transmission line.

Be careful. A comb generator uses very narrow high amplitude
pulses. Yes, the energy is smeared out over a wide band, but the
peak amplitude is still high. It's possible to do do nasty things
to a receiver or spectrum analyzer even though the amplitude of the
particular harmonic seems to be well within the allowable input range.

rec.radio.amateur.boatanchors is worse! Just request some info on some rig you collect, and a crowd of idiots think everything is for sale, at least it is possible to ask technical questions using Rec.Antique.Radio+Phono and you receive lots of valuable info, but I never subscribe to any of these two groups for more than a week at the time

for those of you who still can build their own equipment it is a very
good article by S53MV Matjaz Vidmar "Wideband & Low Noise Microwave
VCO". I listened to him when visiting Weinheim VHF meeting in 1998.
His designs are for 2-4GHz (3 versions: 2013-3829, 2011-4050 and
2388-4593MHz), one might contact him via email and ask if the article
is available, he has an URL. He used only fibreglass PC-boards and
mentioned the quality was just ufb.
Several wideband VCO designs for different frequency ranges have been
described in the Weinheim books since 1988 (Skriptum der Vortr&#65533;ge,
Weinheimer UKW-Tagung), most published articles are written in German,
some foreigners prefer to talk English, while WB5MZJ talked German for
his "100kHz-2.5GHz Signal Generator..."
Believe it is a URL for Weinheim info (...zweiburgenapotheke..?), but
lost it when changing to win98.

A very nice package and unbelievably tame for all the gain involved. As easy to use as an op-amp. You can get the info you're asking for by calling their FAX on Demand service and dumping the data sheets for the device. The FAXCODE is 2098 and the data sheet is 20 pages long.

Hi - did you know that there are digital modes that are intended to be human readable? Well of course, CW is, but there are also visual human readable modes.

One of these, Hellschreiber, and in particular Feld-Hell, is fast gaining popularity among the digitally enlightened hams, because it offers -
- performance hard to beat in any mode except CW
- slick operation, like RTTY or CW
- it's easy to use, the software is free, and is great fun
- it's uncannily like CW, but not such hard work!

All you need is a PC with a sound card and Win 95. If you run PSK31, then you can operate Hellschreiber!

To find out all about this exciting new mode (invented as recently as 1927), and to download all the software you need, visit the all new FUZZY MODES WEB SITE, at:

http://www.qsl.net/zl1bpu/

SEE you in Hell!

my question is: "what is noise power level for 50 ohm in 100MHz BW?"

4402. superhet coil winding

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-24 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7fs7fi$8bj$1@uranium.btinternet.com>
Source record: 70788

I have a circuit of a radio receiver which is designed to cover 1.0 to 2.5MHz. The IF is 455kHz, the mixer being a 3N140 dual gate mosfet with a bipolar transistor as local oscillator and an LM373N as IF amplifier and detector. However, I want to make the receiver to cover higher frequencies, perhaps 12 to 30MHz, in several bands if necessary. I am not sure how to alter the coils, though. The article suggests using a 500pF dual gang tuning capacitor, with 140 turns for the aerial coil, which acts as a load for the RF amplifier (a 2N3819 in common gate mode, capacitivley coupled to gate 1 of the mixer) and 105 turns for the local osc. coil (a colpitts type) for tuning 1.0 to 2.5MHz. The article suggests using 60 and 50 turns to cover 2.5 to 6MHz. (6mm dust cored formers, 30 SWG wire). I need the number of turns to use for a higher frequency range, without changing the IF. I have tried to wind coils for superhets before, but have had no sucess due to problems with tracking, etc. Also, does the SWG of the wire used make much difference? I only have a rough estimate of the SWG of the copper wire that took from a scrap induction motor.
If anyone is interested in the circuit, I can scan and email it to you

From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7fs7fk$8bj$2@uranium.btinternet.com>
Source record: 70789

I was thinking of making an experimental receiver, a simple superhet type, covering a range of about 30 to 60MHz or higher. I wondered if anyone knows what sort of signals I could receive in this range, besides the 6 metre amateur radio band. Would it be worth while building such a receiver, and will the signals be mostly AM or FM? I was wondering if any low-VHF DX signals would be present in this range.

Thanks, 73 de John

4413. Mods of FT-50(Only inside Japan version)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-24 00:00:00 UTC
From: Dongho Lee <leehur@unitel.co.kr>
Message-ID: <3721B940.22A5CF6F@unitel.co.kr>
Source record: 70799
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I got a FT-50N while I traveled in Japan, which is only for Japan inside version. It has limited Rx/Tx frequency range. Only 144-146/430-440 rages are available for Tx and Rx. I believe the basic circuits are same and only couple of configuration blocked Rx range.

Is there any way to convert to FT-50R as US version of FT-50 ? Or is it impossible to convert to expand Rx frequency range ?

Thanks.

- Dongho.

David,

You may want to condsider looking for one of the old
Lafayette monitor receivers. There was a model
that covered 30 to 50 MHz via VFO with provisions for
up to 3 fixed crystals to be installed. It was the size of a
mid-sized cb mobile with 12 volt operation or from the
built in 110VAC supply. I've seen them go across ebay for
around 25 20 30 dollars.

4422. OHR100 and unknown signal

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-24 00:00:00 UTC
From: bshna <bshna@prodigy.net>
Message-ID: <37228977.30E70A4C@prodigy.net>
Source record: 70808

Hello!

I just finished building an OHR100 40 meter kit, aligned it as per the instructions with the help of a fellow ham, and have noticed something unusual (I think). With a 50ohm dummy load connected directly to the back of the set I tune through it's range and hear the normal white noise (hiss). However, at 7.0903 a signal starts fading in starting at a high pitch and gradually lowering. It nulls at 7.0912, and goes from there , low pitch to high, until it fades at 7.0920. This is not too strong, but it is noticable. Then at 7.1222 the same thing starts again, but with a *much* stronger signal. It nulls at 7.1262, and fades out at 7.1303. Now this set is a superhet and recieved signals fade one way or the other as you tune past them. These signals are acting like it's a DC receiver, starting at a high pitch, nulling, then fading out at a high pitch. I have a feeling that something inside the set is causing this. This is my first and only HF rig and I am just getting started with it. Has anyone out there had any experience with this kind of problem on this (or any other) radio? Any help appreciated. 73's!

Brian

True, but it is neat, and it is also faster than most CW ops can copy.
I also like the fact that it is "fuzzy". There's enough redundancy in each
character that a noise hit usually doesn't corrupt it so bad you can't
figure out what it was. It isn't the equal of PSK31 most of the time,
but when auroral flutter phase scatters PSK31, you can still make
out many of the dot matrix characters of S/MT-Hell (IMHO S/MT-Hell
works better than Feld-Hell). You can also copy *several* Hell QSOs
at the same time (provided they're fairly close in frequency to each
other). None of the other digital methods let you do that. That's one
of the advantages CW ops have had to themselves up until now.

I like Gram42 so much that I leave a copy of it running nearly all
the time. Being able to *see* what's going on in the passband is
really useful. I keep it up on a second computer so I can also
be running a different sound card program on the main machine,
usually PSK31. I think I could run two sound cards in the same
machine, but I haven't quite figured out how to do that under
Windoze yet. (Windoze isn't my operating system of choice,
but Linux versions of some of these neat programs aren't yet
available as far as I know.)

Hi,

I'd be grateful if someone can help me locate the specifications for a NEC diode mixer, type 7110Z. Physically the diode mixer is very similar to the Minicircuits SBL style of mixer.

It appears, unfortunately, that the NEC website carries no information on this component.

Regards,
Richard VK5OO

> my question is: "what is noise power level for 50 ohm in 100MHz BW?"

Nyquist's equation:

Vnoise = sqrt (4 * K * T0 * R * delta f)

K T0 = 4.2e-21 at room temperature (300 Kelvin)

Vnoise = sqrt (4 * 4.2e-21 * 50 * 100e6) =

I have found some of these excellent 6B4G valves. 6C4C in Russia is
equivalent to 6B4G and it looks identical to the old Sylvania 6B4G
with double anode stapped together by a metal plate, not the type with
two separate anodes. This 6C4C valves is very well built and is of
high quality. It is unlike the new Sovtek 6B4G which looks more like a
scaled down Sovtek 300B with a single anode.
I don't have many 6C4C left, so e-mail me if you are interested

I may be getting some 3/4 or7/8 inch hard line that is 75 ohms. I remember reading a article about using 75 ohm line. The author only did test up to 2 meters. I want to use this line on 70 cm. Will cotangent transformers work for this band? I have heard if everything else is good you would only get a 1.5 to 1 match any how. Also do I have to mess with the antenna? I would like to use this at a 440 repeater site and the antenna is a 4 dipole array. Is there any one that sells matching transformers?

Any help?

Looking for an old project that may be sitting in your attic from years past. Especially interested in projects out of the magazines in years past for low power tube transmitters (xtal or VFO), receivers (superhet or regenerative FB) or ideally a tranceiver employing these technologies. Completed, not completed, working, non-working OK. Trying to help a older, local fellow's wish to put something from this era on the air to keep him busy.

Will pay shipping and whatever additional value we can agree on...

Thanks,

Alan, N3BJ

ZD Engineering sells transformers for most types of CATV hardline.
They work fine, and also serve as substitutes for the often expensive
hardline connectors. The address I have is 605 Balsley Avenue,
Findlay Ohio, 45840. The phone number is 419-424-8765. ZD
Engineering is owned by Paul Darwactor W8ZD. I've used these
transformers and can recomend them.

(It has been some years since I've bought any. I can't guarantee
that the address and phone number are still good, but it is the
best info I have.)

Since the SWR isn't really that high, and excess SWR loss is
relatively low, the question of why should we care is relevant.
The reason is that the reactive termination can *detune your
duplexer*. This leads to desense problems.

You can work around that in a couple of ways (absorb the reactance
into the tuning of the duplexer, or cut the line to a multiple of a halfwave,
remembering velocity factor), but it is generally better to match the
system up as best you can so you can freely interchange parts without
having to retune the entire system. A pair of these transformers are
useful for doing that. (You still have to get your antenna tuned correctly,
or you'll have SWR on the line anyway.)

I think you forgot to figure in the electrical propagation charteristics of
the feedline.
It is likley you will find a 1/4 wave times .66 to get a closer value.
Thats if I remember correctly and you use a feedline with .66 VF.

With all the high speed logic devices around these days, you
can get harmonics up to several GHz by just clocking a flip
flop and using its own output to reset it, resulting in a narrow
pulse. Motorola Eclinps logic (e.g. 10E131) is great for this.

Above that, you have to use a step recovery diode module to
make a comb generator. The SRD's are difficult to get and information
on applications is mostly out of print. A really good comb
generator requires construction techniques beyond most ham
radio operator capabilities. If you really want to build
a SRD comb generator, count on spending a lot of time getting it
working right and even then, lower your expectations of performance.

Absolutely correct.... but I was not commenting on electrical Vs mechanical
length. Only on 1/4 vs 1/2 wave. You must take into consideration the
propagation factor (typically 0.66 for lots of cable) to go from electrical
to mechanical size. Good comment.

0.66 applies only to solid polyethylthene lines of any
impedance.

If foam-filled or expanded, or disk-supported, with air
space, then a higher VF will apply. Could be as high as
0.94.

HI. I am looking for a board to do the same with some old monitors I have. How about the Radio Electronics/ Harmony Research converter that was mentioned earlier?, 1.would this work with a CGA, EGA or a VGA monitor? 2. Are some CGA monitors TTL and others Analog 3. Could such a circuit work on a SUN /Sony fixed sync (lowest res 1024 x 768) workstation monitor (I have used this on a PC by just modifying the cable and adding a capacitor to combine the sync wires.) 4. What is the resolution of a regular 19" colour TV vs a CGA monitor with composite input or a VGA monitor with an adapter? 5. How much improvement would you get by feeding say a satellite receiver composite video output to the TV with a composite input vs going through a vcr input then via the antenna connection to the TV? 6. Finally has anyone seen another converter other than the Harmony one.

Thanks.
Orville.

I tried 1/4, 1/2, 3/4-wave notch filters - what you choose depends on
the prupose. Second harmonic filter is 1/2-wave on the undesired
frequency

Tried some 2m repeater filter improvement, 600kHz between RX and TX,
3/4 wave configuration with 2.2pF series capacitors. Result 12-15dB
notch, but you must use some extra stubs to optimize impedance for
minimum loss. 12-15dB is not much, it is low, and result of the small
coupling capacitor or 2.2pF.

In an ordinary quarterwave band notch filter you achieve easily 40dB
with a single tuned circuit, and possibly 90-100dB with two tuned
circuits. It is very wide, the series capacitor is used to build a
narrower filter, but has not so much attenuation, the larger capacitor
the deeper notch, but also broader. The coax-stub is inductive on the
frequency you operate, and it is tuned with a tapped trimming
capacitor 1/3-1/5 from the shorted side.

believe the velocity factor for 7/8" heliax(hardline) is 0.82,
cellflex is somewhat higher, possibly 0.9

Howdy Doug....Always interesting to troubleshoot any feedback system as you never know what is cause and what is effect.....so my way of thinking always is to break the loop and try to duplicate control to see what is failing (your loop filter suspicion sounds not bad...just beware of this cause/effect prob). You might lift the output from the loop filter to the varicap (guessing this is the control device) and see if, in unlocked condition, the vco still FM's. Monitor the filter output independantly to see if it's noisy etc. If the VCO still FM's, with the loop broken then look for a problem with its own stability or the control device. If the loop output looks noisy then backtrack to see what is dirty (hetrodyne oscillator maybe....whatever else is in this loop). How does the problem manifest itself....is it instantly upon startup or occur over time? (thinking maybe heat related in the latter case). I'd be more inclined to think an active device the problem more than a capacitor, mostly due to the usually low level voltages on cap's in these stages. I've never even seen the 102 but seem to remember 2 large tuning knobs...you mentioned vcos (more than 1)....do they all exhibit the same problem and are they all in the same loop? If they are all in the same loop then you're back to cause and effect....if not, see what is common with the problem....likelyhood of 2 loops having bad cap's would be suspect in my book.....look maybe for something common injecting noise such as power supply filtering. Just a couple of thoughts on it...best of luck to ya!

Source record: 70846

As its on all bands, first check the master crystal
oscillator for instability. Then any other crystal/LC
local oscillators. You may be able to do these checks
using another receiver in the CW receive mode.

Also check regulated DC supply voltages for instability.

Does the FM consist of random walks, just noisy, or does it
appear to have a regular modulation of some sort.

If the FM modulation frequency is several tens of kHz then
it indicates a severe misadjustment somewhere inside the
phase-lock loop. ie., it is no longer locked but is
wobbling about some centre frequency due to
over-compensation. Symptoms depend very much on type of
PLL.

Try tapping components with your finger nail or something
while listening to a station on the receiver.

Very difficult to locate a fault because the PLL is very
self-compensating for errors. Check DC voltages around
transistors and IC's within the loop. If you have to
change capacitors try electrolytics first.

Do you just want a schematic for interest sake, or are you trying to
repair it?

Those date from 1976 and there isn't anything special about the circuitry.
I found an ad for them in the February 1976 issue of 73, but it doesn't
give much detail. There was a review of a Hufco counter some time later
in 73, but mine are not organized well enough to be able to find the
article easily.

It's going to use a chain og 7490's to divide down the timebase, and a
7490 BCD counter/(maybe a latch, a 7475)/decoder per digit. There is
nothing magical about that, and there really is only a set way to connect
them up so you can easily get the details from all kinds of articles zbout
building frequency counters. The only unique circuitry would be the input
circuit and the rewet circuits.

The January 1976 issue of 73 has an article by Jim Huffman titled "A $50
Self-Powered Counter". It's an almost pocket size unit. It has three
digits and a switch to see the rest of the decimal places. It shows the
input circuitry, which is a 40673 MOSFET feeding a 7413 Schmitt trigger.
I'm not looiing it up, but that's what was used in the K2OAW frequency
counter which appeared in a multi-part article in 73 in 1972. I suppose
there might be slight component variations. It gives some more details,
but it's pretty much some stringing together of some module like circuit
boards that the company made.

The February 1976 issue of 73 has another article by Jim Huffman, "What do
You Want to Count?" It sort of goes into the explanation of those
"modules". There's a three digit counting board, and on it each digit has
a 7490 counter, a 7447 decoder and a 7-segment LED readout. It doesn't
bother with a latch. There's another IC at the bottom of the board which
I can't read, but a schematic for the board shows a 7400.

So if nobody comes up with the schematic, the question becomes: "What's inside?". Is it one whole board, or "modules"? What IC's are on the board? Unless the reference frequency comes from the AC line (it's been done!), there will be a crystal oscillator and a chain of 7490's to divide it down, and they will all be wired up the same way, since they are all dividing by ten.

The display units are going to be something like the
above and layout itself will show a pattern. If it's a bad readout, you look up the decoder IC and see whether it's meant for common anode or common cathode, and then buy a new one. The pinout may be the same, but you can verify by the wiring on the circuit board, since the decoder is a known absolute.

The input circuitry may require some tracing, but if it's
got a MOSFET and a 7413, chances are he used the K2OAW input circuitry, and you jast have to verify the match.

Another popular input circuitry came from a commercial frequency counter and when QST reviewed it, must have been 1972, they showed the circuitry. From there, it showed up in plenty of the frequency counter articles of the time. It was an FET and bipolar transistor buffer capacitor coupled to a 7404 with the first or the first two stages set for linear operation via a feedback resistor. I mention the circuit since it was popular and it might have possibly shown up in the Hufco counter.

If the reference chain is not working (you can check it by figuring
out the dividing ratio and hooking an audio amplifier to a low frequency output (the 7490 data sheet will give you the proper pin) for a tone. Try a different crystal (anything in the same range will give you an indication, and if there's still no tone, then inject another oscillator into the input of the first 7490 (such as from one of those crystal oscillators in a metal can that fit a 14pin dip socket). You'll have to figure your other schemes if still nothing comes out; but since they are digital IC's they will either be working or not.

The reset circuitry may be the most difficult since there are all kinds of ways of doing it. On the other hand, if there are no latches the circuit will be even simpler than most that were published.

The counter may look complicated, because of the number of IC's, but most of the wiring is repetitive. Once you've figure out one digit, the rest will be the same.

Of course, if you've got a blank board this may not be too helpful, unless the IC numbers are silk screened on the board. If it's just a blank board, you'd do well to forget it. Not because it's too much trouble to build a frequency counter with such small scale integration IC's, but becuase it used straight 74xx series TTL that used a lot of current and didn't have very high frequency range and you could do it simpler today with better integrated logic, and more likely CMOS or Schottky.

Hello! I'm in the process of building some VHF receivers using the Motorola MC13135 chip, and am looking for a source for 10.245MHz second oscillator crystals. 11.155 would work as well. I know that I can order them from International, wait for them to be custom made, and pay for a custom crystal.

But! These crystals have got to be mass-produced by the thousands, as they're in every scanner, cordless phone, and cheap 49 MHz walkie talkie on the planet. I've resorted to cannibalizing these items in the past.

The usual sources for parts such as Mouser and Digi-Key have many, many crystals in stock for under a buck, but seem to avoid the typical second oscillator rocks of 10.7 +/- 0.455 and 21.4 +/- 0.455. Strange as Digi-Key sells both the 10.7 crystal filters and .455 ceramic filters for these common projects.

Anyone know of a place to buy these in reasonable quantities for experimenters (10 at a time or so) at reasonable prices?

4463. Re: S-parameters and stability circles

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-26 00:00:00 UTC
From: Langue Rodriguez <languer@earthlink.net>
Message-ID: <372413D1.21375DA8@earthlink.net>
Source record: 70849
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Brad,

The following is from Gonzalez book (Microwave Transistor Amplifiers),
excellent source. Define delta as:
delta= (S11 * S22) - (S12 * S21) ;note that '*' signifies
multiplication here

then the output stability circle (where abs(Gamma In) = 1):
rL (radius) = abs[(S12 * S21) / (sqr(abs(S22)) - sqr(abs(delta)))]
CL (center) = conj(S22 - (delta*conj(S11))) / (sqr(abs(S22)) -
sqr(abs(delta)))

the input stability circle (where abs(Gamma Out) = 1):
rs (radius) = abs[(S12 * S21) / (sqr(abs(S11)) - sqr(abs(delta)))]
Cs (center) = conj(S11 - (delta*conj(S22))) / (sqr(abs(S11)) -
sqr(abs(delta)))

There are also equations for the gain circles in case you don't want
simultaneos conjugate matching on both input and output (say you need
something different from the maximum available - or stable - gain, or
you need broader operating bandwidth). And equations for Noise matching
(or mismatching I should say).

Hope this helps,

Langue

I still have some of these SC cut crystal oscillators, similar
stability to the HP10811 and approach the the best that you can get from
quartz
/small rubidium in long term stability and do better in
short term stability.
This is the only frequncy I have as Im an oscillator designer and
purchased these on the surplus market, they are approximately 10% of the
list price.
Email for price , circuit to lock to any other freq around 10MHZ in 1kHz
steps and fuller spec.

I think you did some math wrong. Scaling from 50 bbls to 5 gallons would indicate .36 ounces in the kettle and 2.27 ounces in the whirlpool (44/50 = .88 lbs per bbl, or 14 oz per bbl or .454 per gallon or 2.27 per 5 gallons). Scaling like this is easy using my recipe calculator, which can formulate recipes of 100+ bbls and then scale to any size or units, and it works in *any* units known to man (because you can add and define your own units). See sig line for more info on my calculator.

Now *that* is cute!

Another stunt I've pulled when trying to tell markers apart is
to use two oscillators on different frequencies. Have one
run continuously, modulate the other. When you hear them both
you are at a common multiple of the frequencies, which should
be large enough not to be ambiguous. An example: 80 MHz
(modulated), 50 MHz (running steadily). Hear them both every
400 MHz.

I've seen this with calibrators, so that (say) the 100 kHz
markers are stady, while the 10 kHz markers are going dit
dit dit...

And I always wanted to port it to the Mac but never found the time.
Theoretically it should be easy since Foxpro is supposedly a cross
platform dev language and I have both the Win & Mac versions at my
disposal.

I am not sure, all is written i cyrillic letters and I don't read that very well.. A sheet with techical data is enclosed with each valve, and the last line reads: 3 4587 03.79 THp 10 000
The 'H' in THp is not a real H, but looks a bit like H.
The valves has a rhombic logo with the number 54 inside and the letters OTK 71 on the glassbulb. In addition to this there is the coding 6C4C, probably a date code: 85 01 and another logo which looks like a circle with a 'C' inside and three short paralell lines one the left and right of the main circle.

The valves has two getters inside, looks like a saucer upside down.
The base is black, and pin 1, 4 and 6 is missing.

Just pay attention to the lenghth so it mirrors the antennas impedance
and it will work GREAT! Tracy

It'll have a "C" logo indicating it was made by the
Svetlana factory. Only place, AFAIk, that made that style
of 6B4-G in Russia, at least in latter years.

The Russians also made 2A3's, but I've never seen one.

>HI. I am looking for a board to do the same with some old monitors I have.
>How about the Radio Electronics/ Harmony Research converter that was
>mentioned earlier?,

>1.would this work with a CGA, EGA or a VGA monitor?

CGA, No. Actually it looks kind of neat, like some special effects
in a rock video (solarization, I think it's called), but not something
you'd use for watching TV programs.
EGA, apparently no, according to the magazine article.
VGA, No.

>2. Are some CGA monitors TTL and others Analog

Yes, back in the early half of the 1980's there were a number of
monitors made to run on both the TV (and CGA) scan rates and on some
of the higher scan rates. The Multisync line, from NEC, among others.
These were premium price monitors that had the advantage that they could
be used on IBM PCs and also on other computers like the Amiga, Atari ST,
Zenith, and various Apple machines that used Analog RGB at TV scan rates.

>3. Could such a circuit work on
>a SUN /Sony fixed sync (lowest res 1024 x 768) workstation monitor (I have
>used this on a PC by just modifying the cable and adding a capacitor to
>combine the sync wires.)

No. The Harmonic Research unit doesn't do scan rate conversion.

4. What is the resolution of a regular 19" colour
>TV vs a CGA monitor with composite input or a VGA monitor with an adapter?

NTSC is a compression scheme. Frankly, it sucks. You can't get more than
100 to 200 discrete color changes in any one scan line. S-Video would be
higher, but not that much.

>5. How much improvement would you get by feeding say a satellite receiver
>composite video output to the TV with a composite input vs going through a
>vcr input then via the antenna connection to the TV?

You might want to ask in one of the rec.video newsgroups or see if they
have a FAQ. Perhaps you'll get some improvement as you'll avoid any
more bandwidth filtering in the TV's tuner and IF, and less distortion
from avoiding the video modulator in the tuner. S-Video would probably
give even more, depending on where they bandpassed filtered the color
information. Also depends on if it's a C-band analog system or a

digital DBS system. With C-Band, it's sent as a composite signal so
you can't get more out of it that was sent in the first place.

>6. Finally has anyone seen another converter other than the Harmony one.

I've seen both Video -> VGA and VGA -> Video converters on the shelf
at CompUSA. About $200. Usually limited to 640x400, as the scan
rate conversion is relativly easy for that mode. Never saw what the
results looked like, though.

I was just wondering why they still keep the Morse code testing requirements if the military doesn't use it anymore and telegraphs are not that common. I think because they stopped it for the marines, there's no point in using it in ham radio either. And if you want to say it is for security, you are not allowed to use codes when intended to obscure meaning.

Hi

Some of you migth find this interesting:
I've implemented a digital audiofilter using a
full duplex soundcard and a computer.
I wrote a program for Linux (NOT Windows or Dos)
that implements low pass audiofiltering. I've used it as
the audio filter on my DC receiver. The source to the
program is free and released under the GPL so if anyone
is interested feel free to try it out.
Some of you might even want to add features to it.

You can find it on my web page: http://www.hi.is/~hkelle/

Considering the comments on velocity factor, you willl want to measure the
resonant frequencyt of the notch with some type of equipment. The stubs
I've built had to be tuned to frequency.

If you need higher notch-Q (at the expense of slightly less notch depth) you
can use a longer stub (i.e.: 3/4 wavelength, 5/4 wavelength - don't forget the

Vf adjustment).

Another approach to improving the notch filter is to use multiple notch
filters
separated by a 1/4 wave transmission line.

```
<--1/4-->
In ------+--------+------- Out
| |
| |
stub stub
```

I've used this techniques to knock down a paging transitter signal located
very, very close (a few feet away). Tuning of the stubs was necessary. Start

with them long, and snip off 1/2" pieces to bring them into resonance. For
longer stubs, RG-213 gives better notch depth than RG-58 (due to lower loss).

Tom, N5EG

I'm looking for some 1SS97 diodes. I need 4 to repair a piece of
professional test equipment. They are used in a UHF balanced mixer.
Ideally I would like say 12 so that I can measure the forward voltage drop
and select 4 matched diodes.

If you have any 1SS97's or know where I can get them please let me know.

Mostly FM. It's commonly set up in simplex to Base configurations.
Mobiles can run 100 watts. Bases often run 300 Watts. It does skip
nicely during periods of heavy solar activity.

Morse Code has its uses and should be encouraged, but not worry too much about those who don't know the code. I think the opportunity to pump signals out on a narrow band to distant parts of the world has its own charms.

The US Marines still use Morse code, and a few of us keep our keys handy just in case.

Howdy Dan....In all the hoopola about whether anyone should or can't use morse anymore.....a few points never seem to be brought out...or are only mentioned briefly.

Morse - Is a mode that allows communications to be copied verbatim easily (you can come close on voice or often do it if words are standardized but its not easy)......
- Is a mode that is indeed digital but which requires the most rudimentary interfacing and for which our own "processor" causes error correcting and speed compensating depending on the ability of the other "terminal" or "line" conditions.
- Is a mode which transcends language and dialect barriers when suitable signals are used...such as the international "Q" signals...and others. Hard to get most computer systems to do that yet and our ability to merely speak one language (english for example) with a wide variation of accents is hard enough sometimes.
- Is a mode whose "standardization" is unheard of in communications, where for at least a hundred years was not obsolete for the purpose of basic communications (stuff that's GOOD for critical use...such as lifesaving...and cheap commerce).
- Is a mode which, when the equipment is tired....just needs a good dinner and a cup o coffee to revive it.....stuff we have around anyway !
- When send using CW transmission (the 2 are NOT the same!) is extremely effective, using suitable narrow filters at both ends, for solid communications under the worst circuit noise and conditions. It might not be the very best...but when you consider the rudimentary equipment needed it becomes mighty attractive.
- Is a mode which, because it only requires very basic equipment, lends itself well to "field repairability".....a handy thing if you've ever sat in a remote spot and listened to digital signals that couldn't connect to you...telling yourself...."if they'd only just turn 'em on and off...I could get the message! After all...what is slower....a slow sent message or one that never arrives????

There's likely lots of other good and bad reasons why anyone should keep morse alive. Yep its old.....but well made and the fact that it hasn't undergone a million transformations tells us all that it works well. It is slow, but when mere text will suffice, is an adequate method of communication in conjuction with simple equipment. It does require skill to use...but everything we do also does (Tell me that a windows NT system hung up on a satellite link doesn't require skill to figure out what happened!). There is also a thing about operating morse that only

morse operators may truely feel...but its a kindred spirit that transcends whether you were a mere ham or a skilled commercial operator, a struggling boy scout trying it or a pilot who was able to make himself understood when his mic stopped working. To that last end I can only offer that to those who WON'T use it...it will always be a thing despised....to those who do or have, a thing revered.

What properties are you trying to model -- leakage current,
dissipation factor, "soak", inductance, ESR? A reasonably complete
model would be very complex, and tedious and time-consuming to build.
And the model would be significantly different for each value and each
manufacturer's varieties. So it's necessary to have some idea of what
properties are likely to be important in your application. This is
true of any modeling, not just for this particular type of component.

Funny, Chapter 8 of "The FCC Rule Book" lists all the modes
available to the Amateur Radio Service and none of those modes
is Morse. I see CW, MCW, Phone, Image, RTTY, Data, Pulse, SS,
and Test, but no Morse.

I believe the International telecommunications Union, the international treaty that authorizes the Amateur Radio SERVICE, requires Morse Code for amateur licenses.

We have been playing with the definitions of how much morse has to be known, copied, skill level, etc. but I believe international law still requires it.

I am considering an open circuit coaxial notch filter for Mode-J (FO-20/FO-29 satellite) interference rejection. Reason I am considering an open circuit is to permit DC continuity (for preamplifier).I would use RG213 double shielded equivalent cable.

What 1/4 wave multiple would be best to trap third harmonic of 145.950 uplink without degrading loss or match at 2 meters??

Dunno, isn't it reasonable to say that NTSC *is* in part a compression scheme? (of course, there's a lot more to it!)

Without any type of compression, the transmission of color of the same resolution as the pre-NTSC B&W TV would require about 15mHz of bandwidth. Both lossless compression (interleaving the color subcarrier components between the sidebands of the B&W signal) and lossy compression (limiting the bandwidth of the color difference signals) are used to fit the whole thing into the pre-color 6mHz channel.

It is much easier to copy something from English to English, It is much harder to copy something from a code back to English and thus more chance for error.

> - Is a mode that is indeed digital but which requires the
> most rudimentary interfacing and for which our own "processor" causes
> error correcting and speed compensating depending on the ability of the

Speech is compatible to 99% of the population's "processor", morse code only to a much smaller percent.

> - Is a mode which transcends language and dialect barriers
> when suitable signals are used...

What?! Neither my English or other foreign language speaking friends can understand morse code. This is a ridiculous statement.

> and our ability to merely speak one language (english for example) with
> a wide variation of accents is hard enough sometimes.

Yes, accents are hard enough, why make it MORE difficult?! If people can't understand a store check-out clerk in some weird accent, how many customers are going to understand him if he emits beeping noises from his mouth?

> - Is a mode whose "standardization" is unheard of in
> communications, where for at least a hundred years was not obsolete for
> the purpose of basic communications (stuff that's GOOD for critical
> use...such as lifesaving...and cheap commerce).

Yeah, that's why Police, Fire and Ambulance don't use it.

> is extremely effective, using suitable narrow filters at both ends, for
> solid communications under the worst circuit noise and conditions.
Completely worthless if the person on the other end doesn't understand code! (which is about 99% of the population)

> - Is a mode which, because it only requires very basic
> equipment, lends itself well to "field repairability"

A washboard is easier to repair than a washing machine too, but not a good reason to mandate people learning to use it before they are allowed to buy a washing machine.

.....a handy thing
> if you've ever sat in a remote spot and listened to digital signals that
> couldn't connect to you...telling yourself...."if they'd only just turn
> 'em on and off...I could get the message! After all...what is
> slower....a slow sent message or one that never arrives????

If no one on the other end understands code, it will never arrive.

Why don't advertisers make all their commercials on radio and TV in morse code so the message could reach more of an audience in bad conditions? Because MORE people would get the message EVEN IN BAD CONDITIONS if it is in voice, than in a secret code that they don't understand.

> There's likely lots of other good and bad reasons why anyone should keep
> morse alive.

There is only ONE. Because it is nostalgic and fun for many people. Don't take the fun away by forcing it on people that don't want to use it.

I bet if morse code was not a requirement (for certain classes of license) more people might take it up. No one wants to learn something that is forced opon them. People choose hobbies because they have an interest in them, not because someone hands them a fishing pole and orders them to fish!

> understood when his mic stopped working.

You people with your mic stopped working BS. Or stranded at the north pole with nothing for miles but a payphone with a broken microphone. Always have to try and make up some unrealistic situation to show how morse code could actually be usefull, and then THAT doesn't even fly!

I don't know of anyone ever going to be in the above situation, but even IF... would the operator on the phone or the police understand the code you are punching in on the touch tone pad, or would they think it is a prank call and hang up? Doesn't really matter, as this situation will never occur to either of us. They don't have payphones in the middle of the north pole. Especially with non-working microphones and working touch tone pads.

To that last end I can only
> offer that to those who WON'T use it...it will always be a thing
> despised....to those who do or have, a thing revered.

Think about what you just said! Think about WHY it would EVER be DESPISED! NO ONE would ever depise it if it wasn't shoved down anyones's throat!

People don't DESPISE model airplane kits. They might if people were
FORCED to build them in order to take up some other hobby!

ALL the below are VERY CORRECT and TRUE, BUT,
is that ANY reason to use it on a TEST for getting your ticket
keep the subbands..if you want, EXPAND them if you like
IF we use this MODE to test people should we not have a test to see if you
can talk correctly for phone, type correctly for packet,
and expand that by building your own computer for digital modes.
THAT'S ALL I AM AGAINST IS FOR A TEST
keep the mode if it makes you happy but don't use it for TESTING.

I am looking for a couple of 10GHz gunnplexers for a uW
newbie WBFM ham project. Something surplus like M/A-Com or
Solfan 10mW units will do. I would also be interested in
horn antennas and/or small parabolic dishes.

Anything like that kicking around?

Thanks
Allan Dobler VE6XK

This may be an accurate statement, but it implies that a 10pf
cap can restore the resonant frequency of the shortened stub.

Thy this thought experiment. Start with a 10" section of line.
Cut off all 10" and relpace the entire length with a 25pf cap.
Does it resonate at the same frequency?

When you cut the line, you also remove the distributed inductance
associated with that section.
You can calculate the effective capacitance required to resonate
the line, but the calculation is more complex.

Hi all. is there an easy way of creating an electrolytic
capacitor in p-spice ver 8.0. There is a schematic
symbol for the standard cap but nothing doing for
electrolytic types. Can't seem to find any reference
to one in the docs...

Any info would be most helpful..

Thanks JD.

Well if you have to tune the stubs, would it also follow that you
would have to tune the section between the stubs? If so, how would
you do that?

Here, here!

I've been trying to explain to wife/family/friends for over 30 years,
and haven't ever come up with a "reason" for using CW that satisfies
those that don't have the experience. To those who have conquered
their demons, learned to communicate via CW, and discovered the reward
of it, no explanation is necessary.

If the code requirement is dropped (as it may well be), the incentives
that lead one past the hurdles of learning the code, to the most
rewarding experiences offered by CW, will be removed, and perhaps the
ranks of CW ops will diminish. Some will be happy if this should be
the case.

I think it's interesting to observe, that since the proliferation of
digital modes in the last ten years or so, CW activity on the ham
bands seems to have grown, not diminished, both here in the States and
internationally. Considering that many countries don't have a code
requirement anymore, I wonder why that would be, if it truly is a dead
mode?

Saying CW is dead is kind of like saying pianos are useless because
PCs with sound cards can make more sounds, and never need tuning.
Those who play or listen to fine pianos can instantly perceive the
difference, and those whose minds are made up won't be listening for
pianos in the first place.

When I got started 33 years ago, I struggled for a year to get my code
speed to 13 WPM so I could get my "general" ticket and move on to fone
and rtty operation. But 99% of my operation since then has been CW.
Go figure, huh?

If you just need a capacitor with a value usually realized with an electrolytic capacitor then you can simply use the symbol for a normal capacitor. If you need to care for "real" properties of an el. capacitor, like leakage current or its inductance, try adding a paralle resistor to model the leakage current, a serie resistor to model its ESR, and so on.

Howdy Cecil.....Interesting point - often confused.....CW, MCW etc are modes of operation for a signal source.....morse is a mode (method) of communicating information, like voice etc. I know you know the difference of course....what I see is when green hams (we were all one eh!) start to confuse all this not understanding that you can send morse over an FM circuit by keying a tone or by calling that CW. Then they're scratching their heads the first time we show 'em a signal generator heheh.
I think we all ought to make our "tech" talk a little more accurate by times...maybe.

Well, sorry that the fonts messed up the drawing. It's
pretty easy to tune the series section. Use 'T' connectors
for connecitng the stubs, the input line, the output line,
and the series 1/4 wve section.

Build the 1/4 wave series section by soldering a connector on
one end only, then temporarily configure it as a stub in a simple
test setup. Then tune it for a notch on the desired frequency
by snipping off little bits of the non-connectorized end. Snip off
just a little bit more to compensate for the connector that you will
then be putting on the open end. Install the connector, and you
now have the series line section.

Hello. I just recently received my Tech license and I have a hand held only right now. I was reading an old ARRL book that I found in the school library and it mentions the wonderful idea of building your own rig. Now this has 2 apparent rewards. one is that you have the gratification of knowing you built your own rig and two the savings of building the radio yourself. My hand held is a dual bander and i like it for its versatility but I would really like to build my own. I thought what better place to get suggestions than this news group. Please keep in mind that I am brand new to the hobby but i do have some good experience with soldering and schematic reading as I am an EE major and I have done a couple of internships where I did get some hands on training with various engineering jobs. I looked at 2 web sites on the internet one for a company called Ramsey and another for a company called Ten-Tec. What do you guys think of these companies? Good deal? Poor Quality parts? What I wanted was a 220 MHz transceiver or even a dual bander that can get 2 meters and 220 MHz. Can anyone help me with suggestions or advice? I am really in need. Thank you very much for taking the time to read this......73's KF6VVQ joseph

>100 to 200 discrete color changes in any one scan line. S-Video would be
>higher, but not that much.

Actually, NTSC is *not* a compression scheme. Resolution is limited by the bandwidth allocated for the signal, and by the scan rates chosen. Typically, horizontal resolution is about 225 lines, but because it is interlaced, the effective resolution is actually about 450 lines. Vertically the resolution is limited by the scan rate to 262.5 lines per field, doubled to 525 lines by interlace. (Because of the way the lines of a test chart fall on the interlace, the vertical resolution is actually only 262 lines, IE to resolve a line requires a transition, and that requires two vertical scan lines to reproduce.)

If this doesn't quite make sense, picture a test chart with vertical and horizontal lines drawn on it. The vertical lines are resolved by the horizontal bandwidth of the TV, and the horizontal lines are resolution limited by the number of scan lines in a field. So NTSC should yield a resolution of about 450x262. It usually doesn't quite do that well horizontally because most receivers aren't adjusted to recover the full transmission bandwidth. 320x200 is closer to what you see on the typical home receiver with an off the air picture.

But that's not nearly as bad as it may sound to computer types used to talking in terms of pixels. NTSC is analog, a transition can occur *anywhere* on the screen. Transitions aren't limited to discrete locations as they are in computer displays. This yields an *apparent* resolution which is much better than can be achieved with a CGA computer display. For example, there are no jaggies on slanted lines with NTSC, but there are with computer generated graphics. This analog nature also shows up benefically for objects in motion. The movements are all smooth.

Hue is also analog, and can vary in infinitesimal steps. You aren't limited to a preset number of colors as you are with a computer display. This turns out to be very important because the human visual system is more sensitive to differences in hue than it is to differences in spatial resolution. That's why TV pictures look lifelike while higher resolution computer displays still look like a cartoon. The *apparent* resolution of NTSC is a close match for 16mm film (that was chosen deliberately when the standard was formulated).

Of course, from the way the poster you're answering spells color as colour, we can assume he's in a PAL country. The bandwidths and scan rates are slightly different for PAL than for NTSC, with the advantage going to PAL. So he should see somewhat better resolution than we would.

To approach the apparent resolution of NTSC requires a computer display running 800x600 with 16 million colors. It will still have visible artifacts that will identify it as pixelated compared to an analog TV signal with moving pictures, but it will be close to the same visually if you sit back from it the standard 9 feet used for TV viewing.

Now HDTV *is* compressed for transmission. That's a different kettle of fish entirely. Channel bandwidth would have to be over 100 MHz to transmit HDTV without compression. HDTV uses MPEG 2 compression to reduce the bandwidth to fit in a 6 MHz RF channel. MPEG 2 is a lossy compression, so there are artifacts, and the HDTV picture is wider than NTSC, so it *needs* more horizontal resolution to equal the apparent sharpness of NTSC.

The end result is that HDTV at 1080i has about twice the apparent resolution of NTSC. It looks really good, about equal to 35mm movie film (again that was a deliberate choice). But because it is digitized, and because of the lossy nature of the compression, there are some artifacts. You'll notice some strobing on areas of solid color. Jay Leno's desk is a good example. In the two shot with the guest, you can see a bit of strobing of the desk. Still, the amount of detail you can see is really breathtaking. The closeups during Jewel's number Monday night had you believing she was in the room with you. (The 5 channel surround sound doesn't hurt the realism either.) When Jay goes into the audience, you feel like you are there in the audience too. There's none of the fuzziness and loss of depth of field that you get with NTSC. (The latter is partially due to the way the show is lit, of course, but it is mostly due to the inherently higher resolution of 1080i.)

4548. Signal Generator as VFO?

Newsgroup: rec.radio.amateur.homebrew

From: Will White <wcw@asu.uswest.net>
Message-ID: <37274AFB.FCC3B5B@asu.uswest.net>
Source record: 70920

I seem to recall reading somewhere that one can use an RF signal generator as a temporary VFO for homebrew receivers. Is this correct? How is the generator connected to the receiver? Also, is it possible to use a similar arrangement for transmitters?

p.s. my interest here lies in the hollow-state stuff.

Ramsey is known far and wide to be a great place to get EE training.
In other words, you will have many hours of joy trying to get your
project to function.

Ten Tec is at the other end of the spectrum from Ramsey. They have a
reputation rivaling the very best that ever graced the electronic kit
business (Heathkit).

I speak from experience, having built projects from both companies.

You will learn a lot from building kits from either company. One of
the learning experiences will be more pleasant, however.

Feel free to e-mail further questions...

One fairly important part of the "and so on" could be a diode shunting
across the capacitor, if it is a polarized type. Usually electrolytics
become very leaky if you try to apply reverse voltage. Depending on the
application, the same effects (usually not including the diode) might be
important with other types of caps, too. That is, at RF, you might care
about the inductance in a Mylar cap. And in a precision integator, you
might be interested in the dielectric absorption of even a polystyrene
or a Teflon capacitor. For a lot of uses, though, it's fine to just use
the standard SPICE capacitor. All this points out that SPICE is a fine
tool, but it's not a tool to replace your brain. You still need to
think carefully about what the answers are telling you, and understand
the limitations of your model. -- You may be able to find articles on
modelling various real-world components with the idealized SPICE
components; they fairly often pop up in magazines like "Electronic
Design" and "EDN."

(Just yesterday, I started work on "reforming" a photo-flash
electrolytic that had been uncharged for at least 10 years and became
very leaky above about 25 volts at first.
That would be an interesting effect to try to model! -- that 330V cap is
now up to about 250 volts, after being charged with 1mA or so
overnight. Remains to be seen if it still will flash the lamp
properly.)

Cheers,
Tom

I think that if you attach a mechanical device like a wind-up timer to the case of an old RCA or Eico RF signal generator you will be relieved of any necessity of physically tuning the receiver or transmitter and be able to hear many different frequencies within milliseconds. It is also best, in my recollection, to place such a device in a drafty environment and, if possible, attach it to the same ac outlet that an airconditioner or vacuum cleaner runs off.

How big? If you mean "good=cheap," you'll have to scrounge the surplus markets and hamfests. Don't bother with most of the commercial surplus houses mail-order, because nowadays they're nearly as expensive as new. Consider broadcast surplus and powerline surplus -- you might get lucky. You might also find surplus from semiconductor manufacture -- they used plasma generators in a lot of processes that were basically 3 KW amplifiers for 13.56 MHz, running some really big tubes.

If "good=good" and you need full legal limit, try Peter Dahl.

If "good=I made it myself" there are some transformer winding articles way back in the archives of 73 that offer some ideas. There is also a rumor that you can successfully "fix" a microwave oven transformer so it won't saturate. Interestingly, all the online microwave oven conversion articles I've seen referenced have vanished -- seems it's c onsidered too dangerous to publish these plans, but the stuff about homemade bombs and drugs is still out there.

I thought the code requirement was for INCENTIVE purposes for a HOBBY that obviously needs to be regulated by the government so it won't turn into a fiasco like the mistake that happened with CB. You don't need to learn CW to be a ham and if all you want to do is rag chew on local 2 meters or other VHF/UHF freqs that's fine. They did away with CW in most military services because there are more effective ways to communicate reliably in war time. War is not a hobby (to most) and the military has a hard enough time teaching people with a 6th grade level education how to fire a million dollor rocket by "pushing the RED button" that they don't have time to spend teaching a HOBBY to 6th graders, most of who did not want the job to begin with! Ham radio is not a "way of life" it is a fun way to enjoy life. A code requirement provides incentive to upgrade. Our society (meaning the United States) over the last 10 years or so have become a bunch of whiners and get really irritated when told "no--you can't have it all right now!" If prospective hams spent as much time focussing on learning the code as they have whining about the requirement--there would be a lot more general class and higher I am sure. I don't like stop signs. Sometimes I like to drive fast. I think gas should be as free as water and I should not have to buy insurance and pay taxes. Learning the code shows you are somewhat dedicated to your hobby and perhaps worthy of increased frequency priviledges thereby allowing you to communicate with others who enjoy the hobby in other parts of the world. You are in effect an ambassador of the US! We could use more good ambassadors, that't for sure. Look at all the lids (former or current CB'ers) who took the time to learn the code then abuse it on 20 and 75. Perhaps the FFC is finally getting around to some long needed enforcement and are taking away the privilege. Just like driving--it is a privledge--not a right. So you don't need to learn much to ride a bike (scanners) but need more to drive a car (vhf/uhf no-code) but you need more road tests for cycle endorsements, big rigs, hazardous materials, flying an airplane, jets etc., pass 5 wpm you get some limited HF. Pass 13, you get to play with big rigs and big amps. Pass 20, you can do it all. I'd like to do it all and fly a jet but don't have the time to learn it all and get my 20 just yet! And I still shy away from the CB-like chatter on the ham bands, but still love to chat on 2 meters and give out my 1010# to all the KC***** call signs I hear on 10 meters. I always try to tune into a CW rag chew just to see how many characters I can copy at 20+wpm from the oldtimers who don't need to write anything down! A friend of mine has over the last year spent close to $50,000.00 on antennas including a 3 element rotatable full size yagi at 180 feet. 12 monoband antennas in all, and ALL are cut for the CW portions of the ham bands. CW is alive. Just because the military did away with it does not mean hams should also. After all, I want a college educated officer to get a VERY clear error free packet transmission before he tells the 6th grader to "push the RED button!" Kwitchyerbitchen and learn the code--or don't drive the big rigs!

Howdy Dan....In all the hoopola about whether anyone should or can't use morse anymore.....a few points never seem to be brought out...or are only mentioned briefly.
Morse - Is a mode that allows communications to be copied verbatim easily (you can come close on voice or often do it if words are standardized but its not easy)......
- Is a mode that is indeed digital but which requires the most rudimentary interfacing and for which our own "processor" causes error correcting and speed compensating depending on the ability of the other "terminal" or "line" conditions.
- Is a mode which transcends language and dialect barriers when suitable signals are used...such as the international "Q" signals...and others. Hard to get most computer systems to do that yet and our ability to merely speak one language (english for example) with a wide variation of accents is hard enough sometimes.
- Is a mode whose "standardization" is unheard of in communications, where for at least a hundred years was not obsolete for the purpose of basic communications (stuff that's GOOD for critical use...such as lifesaving...and cheap commerce).
- Is a mode which, when the equipment is tired....just needs a good dinner and a cup o coffee to revive it.....stuff we have around anyway !
- When send using CW transmission (the 2 are NOT the same!) is extremely effective, using suitable narrow filters at both ends, for solid communications under the worst circuit noise and conditions. It might not be the very best...but when you consider the rudimentary equipment needed it becomes mighty attractive.
- Is a mode which, because it only requires very basic equipment, lends itself well to "field repairability".....a handy thing if you've ever sat in a remote spot and listened to digital signals that couldn't connect to you...telling yourself...."if they'd only just turn 'em on and off...I could get the message! After all...what is slower....a slow sent message or one that never arrives????

There's likely lots of other good and bad reasons why anyone should keep morse alive. Yep its old.....but well made and the fact that it hasn't undergone a million transformations tells us all that it works well. It is slow, but when mere text will suffice, is an adequate method of communication in conjuction with simple equipment. It does require skill to use...but everything we do also does (Tell me that a windows NT system hung up on a satellite link doesn't require skill to figure out what happened!). There is also a thing about operating morse that only morse operators may truely feel...but its a kindred spirit that transcends whether you were a mere ham or a skilled commercial operator, a struggling boy scout trying it or a pilot who was able to make himself understood when his mic stopped working. To that last end I can only offer that to those who WON'T use it...it will always be a thing despised....to those who do or have, a thing revered.

To begin with, do not use a gate oscillator in a microcontroller as
the oscillator circuit. Instead, build an analog oscillator using
a discrete transistor. Secondly, get a low tempco crystal, not a
microprocessor grade crystal. Then, if you still need more stability,
you can think about temperature compensation.

Hi ,Dan!

Well, in just a few short days, you've managed to create quite a stir
with your question (wink) ... 19 replies so far, and I bet it ain't
over yet. I've noticed in the past, that nothing gets things stirred
up quite so much as code and licensing issues. Anyway, well done!

I'd like to make an observation about human nature. [Now, please
understand, I'm not talking about you. Heck, you asked a question,
and you seem to be the best example of an open mind I've seen in this
thread so far.] Anyway, I've noticed that when my mind is made up
ahead of time, it tends to adopt as its purpose to support that
decision in any and every way it can. And once that purpose is
established, it will endeavor to interpret everything I hear and see
as evidence I am "right". It doesn't make me right, mind you, but
it's a mighty temptation to judge everything and everybody as either
threatening or supportive, with no gray area between.

So whenever I encounter myself feeling defensive (or offensive) about
a subject, I suspect I've pre-determined how I want things to be, or
how I want things to come out. And that's a warning signal to me that
my mind is pretty much closed. For me, the warning flags went up when
I though somebody might threaten my beloved CW.

But on re-examination, I think both "sides" can find common ground.
We don't necessarily need code proficiency tests for everyone to prove
they can do it ahead of time. Nobody's going to get on the air
sending morse when they only know 12 letters of the alphabet. So,
maybe just a sampling of questions on the written tests, concerning
the use of the mode, would be in order - to show an understanding of
the mode and its operating procedures, for those who have the
potential for using CW. Same would apply to voice, digital modes,
repeaters, satellites, anything that has significant usage on the ham
bands.

After that, it's up to us avid CW fans to promote and expose the positive and rewarding aspects of the mode (and there are many). We haven't done a good job of that thus far, maybe as a result of being so defensive.

As for actually learning CW, when I think about it (at least for me), the fastest part of the learning curve was when I was practicing it "on-the-air", without the pressure of "having to pass a test". It also happened to be the time that I really learned to love it.

Come on, folks - both pro and con - let's look for new viewpoints, consider them with an open mind, and see if we can't make the amateur service even more fun and more friendly than it already is.

Hi Joseph!

Congrats on the new ticket, and welcome to the ranks.

Kits are loads of fun, and there are lots of links to homebrew
projects on the net. The following are not my own sites, but I know
they have LOTS of links you'd be interested in, so I offer them here:

http://www.ac6v.com/pageay.html (HAM RADIO KITS)

http://home.earthlink.net/~af4k/hamlynx/hamhomeb.htm (AF4K's
HOMEBREW)

There are enough links here to keep you busy for many moonsweekends,
and you'll find lots to satisfy your homebrewing urges.

There's nothing quite as satisfying as building something yourself,
and finally seeing it work... but I suspect you already knew that,
being an EE student.

Have fun & 73,

monty N5FC

>a temporary VFO for homebrew receivers. Is this correct? How is the generator
>connected to the receiver?

Hi, Will!

Sure you can. Just couple it into the mixer and/or front end with a
small loop of wire, or a very tiny "gimmick" capacitor made from two
small insulated wires twisted together, but not otherwise electrically
connected. Don't expect to much performance wise: signal generators
are typically noisy or warbly or drifty. But it'll work to get the
rest of the circuitry working.

>Also, is it possible to use a similar arrangement
>for transmitters?

Probably not a very good idea, but if the signal generator were
atypically stable, it would probably be OK.

Let us know how it works!

Message-ID: <7g8vbc$bn1@nnrp3.farm.idt.net>
Source record: 70748

Thanks for the info everyone. The Peter Dahl company has a good selection but the price is "up there" too. I am thinking about using some used industrial control transformers run backwards (120vac to 480vac). With two control transformers connected in series and working into a full wave voltage doubler will also work for the supply I'm thinking about. I think I can find these control transformers for less than the cost of a new/used single plate supply transformer. I was hoping that the single plate transformer solution was as cheap or cheaper that the dual industrial control transformer idea.

4569. temp. comp. of an Xtal oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-29 00:00:00 UTC
From: Arjen Raateland <Arjen.Raateland@vyh.fi>
Message-ID: <37280315.2FAE@vyh.fi>
Source record: 70749

I have built a frequency counter from a kit. It has a 16 MHz time base Xtal oscillator that I would like to apply tempreature compensation to.

I got one schematic from a fellow ham that doesn't work for me as it should with the components I built it with, so I'd like to read up on the matter.

In the oscillator circuit the 16 MHz 'miniature' Xtal sits between two pins of a PIC and from each pin there is a trimmer cap to ground. I think you recognize the circuit. There is a varicap diode with adjustable reverse voltage for the compensation over one of the trimmer caps with a styroflex cap of 150 pF in series. The trimmer caps are of different types. One is 'teflon' and the other just 'foil'.

I'd like to have information/literature/links on how to compensate an Xtal time base oscillator for temperature variations, so that I can attempt to get the compensation to actually work. (I'm not attempting rocket science, however.)

Thanks for reading this.

ke4zv@bellsouth.net (Gary Coffman) writes:

>Actually, NTSC is *not* a compression scheme. Resolution is limited by
>the bandwidth allocated for the signal, and by the scan rates chosen.
>Typically, horizontal resolution is about 225 lines, but because it is
>interlaced, the effective resolution is actually about 450 lines.

No, that's not correct. The ratio between the bandwidth and the
horizontal sweep gives the number of cycles that can be resolved
horizontally. Interlace has nothing to do with horizontal resolution.
The ratio between the 4.2 Mhz broadcast bandwidth and the 15734 Hz
horizontal sweep is about 267. However, about 15% of the horizontal
period is non-picture information, so you'd expect to be able to
resolve about 225 cycles per picture width. Now, TV resolution is
measured in "lines", not "line pairs" like photography, and you can
resolve 2 "lines" in one cycle (the Nyquist limit popping up again).
So you'd expect to be able to resolve an absolute maximum of about 450
(vertical) lines across the width of a broadcast TV image.

However, TV horizontal resolution is quoted in "lines per picture height"
(to make it comparable to vertical resolution), not lines per picture
width, so you have to multiply by the 3/4 aspect ratio to get the
official figure. As a result, broadcast television is limited to a
horizontal resolution of about 340 lines per picture height.

VHS is worse, about 250. SVHS is better, and analog videodisc is
better yet - about 550 lines.

>Vertically the resolution is limited by the scan rate to 262.5 lines
>per field, doubled to 525 lines by interlace. (Because of the way the
>lines of a test chart fall on the interlace, the vertical resolution is
>actually only 262 lines, IE to resolve a line requires a transition,
>and that requires two vertical scan lines to reproduce.)

Again, not quite. The number of active lines per field is somewhere
around 240-243 - the rest are used up by non-image information. Due
to interlace, the lines from even fields are drawn between the lines
from odd fields, so a properly operating TV (with no overscan) will
show about 480-486 actual scan lines.

According to the Nyquist limit, this many scan lines allows you to
display about 240 cycles or 240 line pairs or 480 lines per picture
height. But if you tried to approach this, you'd find that either the
pattern would go grey, or it would flicker madly since all the white
lines are in one field and all the black lines are in another field -

either way it's not pleasant.

Because of interlace, and because the scanlines overlap somewhat, the actual useful vertical resolution is about 70% of the theoretical limit - about 335-340 lines per picture height. (This 70% factor is called the "Kell factor" in video literature). Note that for broadcast television, the horizontal and vertical resolution is about the same - this is not an accident.

>If this doesn't quite make sense, picture a test chart with vertical
>and horizontal lines drawn on it. The vertical lines are resolved by
>the horizontal bandwidth of the TV, and the horizontal lines are
>resolution limited by the number of scan lines in a field. So NTSC

>that well horizontally because most receivers aren't adjusted to
>recover the full transmission bandwidth. 320x200 is closer to what you
>see on the typical home receiver with an off the air picture.

Well, a *good* NTSC monitor should be able to display about 340 lines (counting both black and white ones) vertically and about 440 lines horizontally. Typical TVs may well be less.

>But that's not nearly as bad as it may sound to computer types used to
>talking in terms of pixels. NTSC is analog, a transition can occur
>*anywhere* on the screen. Transitions aren't limited to discrete
>locations as they are in computer displays. This yields an *apparent*

>computer display. For example, there are no jaggies on slanted lines
>with NTSC, but there are with computer generated graphics. This analog
>nature also shows up benefically for objects in motion. The movements
>are all smooth.

It's not that simple. NTSC is analog horizontally only - it's just as discrete as any frame buffer vertically. You don't see discrete locations vertically in video because the signal is adequately low-pass filtered during sampling. But that can be done equally well in computer-generated images - and often is in high-quality pictorial images. This low-pass filtering is not usually applied to window edges or to text on computer displays, because the apparent sharpness of the unfiltered version is preferred.

Jaggies are also caused by a failure to low-pass filter the image before sampling - they are aliasing artifacts in the spatial domain (instead of time). They can be reduced or eliminated by "anti-aliasing" techniques, which are just low-pass filtering. Well-filtered computer-generated images do *not* show jaggies.

The appearance of smooth motion in video is because of the 60 Hz sampling rate in time, combined with motion blur. Both of these are possible, if not yet common, in computer-generated imagery.

>Hue is also analog, and can vary in infinitesimal steps. You aren't
>limited to a preset number of colors as you are with a computer

>display. This turns out to be very important because the human visual
>system is more sensitive to differences in hue than it is to
>differences in spatial resolution. That's why TV pictures look lifelike
>while higher resolution computer displays still look like a cartoon.

Uh, have you looked at any good computer displays lately? Say, with
24 bits or more per pixel? Displays with only 8 or 16 bits per pixel
have to quantize the colour to a small set of available hue/saturation/
intensity values, and this creates areas of solid colour with "jumps"
between areas. With 24-bit colour (or more), the steps between adjacent
representable colours are so small that you can't see them, and the
appearance is indistinguishable from continuous colour.

In fact, most video broadcast these days is *also* quantized to 24 bits
since that's all the digital video recorders record. There are fewer
possible colours than in computer graphics, because video uses up some
of the 256 values for sync and blanking, and fewer are left for actual
image information.

>The *apparent* resolution of NTSC is a close match for 16mm film (that
>was chosen deliberately when the standard was formulated).

Well, for 16 mm film 50 years ago. These days, good fine-grain 16 mm
film has far more resolution than NTSC, and in fact is a pretty good
match for HDTV. (It also depends on whether you're talking about
negative resolution or on-screen projected resolution - see below).

>Of course, from the way the poster you're answering spells color as
>colour, we can assume he's in a PAL country. The bandwidths and scan
>rates are slightly different for PAL than for NTSC, with the advantage
>going to PAL. So he should see somewhat better resolution than we
>would.

Not necessarily. I spell colour the conventional (British) way, yet
I watch NTSC television identical to what the USA sees.

>To approach the apparent resolution of NTSC requires a computer display
>running 800x600 with 16 million colors. It will still have visible
>artifacts that will identify it as pixelated compared to an analog TV
>signal with moving pictures, but it will be close to the same visually
>if you sit back from it the standard 9 feet used for TV viewing.

No, a 640x48 display is sharper than NTSC, because its limiting resolution
really is 640x480 lines, not 440x340. And it can do that for all three
colours, not just luminance. The chrominance resolution of NTSC, as
decoded by most TVs, is about 50 lines across the picture width - one
eight the resolution of luminance (because the bandwidth is only 0.5 Mhz).

In addition, if the image being displayed is properly filtered, you
will not be able to see individual pixels or scanlines, nor more
motion artifacts than NTSC.

For a demonstration of this, take the highest quality digital *picture*
you can find, preferably from a Photo-CD or a good film scanner.
Reduce it to 640x480 using something like Photoshop. Then record the
same image in NTSC, using the highest-quality video output system you
can get your hands on. Compare it to the 640x480 image on a computer
monitor. The NTSC version is just not as sharp, though it's often
surprisingly good for most natural scenes.

>The end result is that HDTV at 1080i has about twice the apparent
>resolution of NTSC. It looks really good, about equal to 35mm movie
>film (again that was a deliberate choice).

It depends on how you measure 35mm resolution. HDTV is comparable to
or better than a 35mm print shown on a standard 35mm projector, at least
in resolution. But a 35mm negative scanned on a good scanner has at least
twice the resolution as HDTV. The difference between negative and
projected release print is partly due to the multiple generations in
between, but mostly due to poor stability in the projectors.

So HDTV is equivalent to 35mm film for projection, but not equivalent
for original image capture. It depends on what you're talking about
using them for.

4571. List Of Stamp Applications [990429]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-29 00:00:00 UTC
From: cjX@hth.com
Message-ID: <3727b91d.26300699@news.buller.se>
Source record: 70751
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 4 years later there are 150+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may
be dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address
and/or web-links. I'm only able to keep the list updated if I'm

informed about changes, thanks in advance.

1.3 List of contributions

4572. 1.288Mbps PSK

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-29 00:00:00 UTC
From: Anthony Hall <term@seesaw.wustl.edu>
Message-ID: <7g9gbu$1f9$3@news1.mpx.com.au>
Source record: 70752

Hello,

Has anybody built the 1.288Mbps PSK Data link by hamradio.si in the Hardware Page under the 13cm/23cm PSK Data Link?

If so, could you please email me the components used and possibly suppliers of these ?

Better drawings would be great..

4573. Glowbugs & transformer-less power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-29 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <372847D6.73ACD202@asu.uswest.net>
Source record: 70753

I need info on constructing a voltage-multiplying (doubler?) transformer-less power supply for a couple of glowbug projects I want to get started on. Something like or better than those used in All-American Five AC/DC sets. My budget precludes the acquisition of any HV transformers for the time being. So I need hints, advice, consent, a schematic, bibliography, and what-all to do this *safely.*

I could also use some suggestions as to tube selection. I want to start with a 2 or 3 tube regen. RX (I have several 6L6s, OD3s, and 5U4Gs for a transmitter project for later). Thus far, I am looking at a 6U8 design, but from memory it seems that tube takes either +150 or +250V on the plate, and either would be tricky with above said doubler supply. So, what bottle fits the bill here?

Source record: 70754

Yes, it is possible. Just connect it into where the normal local oscillator would go.

I would hesitate to use it for transmitting, unless you mean for testing purposes on a dummy load. Most signal generators available to hams are not very stable and may have some spurious signals on the output.

Now, if you are fortunate enough to have some one give you one of the new $20000 synthesized generators from HP, go right ahead....it is probably better than the one built into the transmitter!

My signal generator is capable of producing exceptionally clean
and highly stable
signal source of modulated or unmodulated carrier. Indeed being an avid
QRP op I have used it as a VFO and even a transmitter. Your not by chance
using the fine "glass fet" variety of the bygone era are you?

Modern Digital Signal generators dont have to work in the "SWEEP" mode
at all.

You missed the point. the comment was the military doesn't use it , not true in the case of the coast gaurd. The guy was taught code as part off the m.o.s. to be a radio operator.
I think as far as the coast gaurd the military still thinks it is important to have coded operators.

Just a quick fix on the web address for Ten-Tec. It should
be "http://www.tentec.com". The one you listed connects you
to some other strange site.

But, I do agree that Ten-Tec has a lot of good stuff. I have
been considering the 10 Meter to 2 Meter transverter myself.

Seems somewhat high in loss. If using decent coax (Semi-Rigid is
better) then

expect ~27dB notch and less than 1dB I.L. for 1/4 Wave. 3/4 Wave will give
you a narrower, but deeper notch. I found these useful for additional harmonic
attenuation from amplifiers.

4586. Re: Glowbugs & transformer-less power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-29 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.SOL.4.10.9904291150300.29217-100000@Stratus.CAM.ORG>
Source record: 70766

There are really good reasons for using a transformer in a power supply. Things like the All-American Five and tv sets may have gone without transformers, but they were all carefully designed so you couldn't touch any metal parts and any input and output were carefully isolated.

I'm not sure that you can ensure that at a home made unit will be properly isolated, especially when you have to get the piece of equipment working after it's built and would probably not be concerned about keeping it in a plastic case with all the knobs on at that point.

But unless you are talking about high power, one way to get isolation is to use back to back low voltage transformers of appropriate wattage, so you feed one from the AC line and get say 12 VAC out, and then you feed that into the 12VAC side of another transformer and get 120VAC or whatever out of it. You still have to deal with filament (the old tv sets and radios used tubes with exotic filament voltages in series that all added up to the AC line voltage, which restricts what tubes you can use and if one filament goes bad it's not immediately obvious), and probably getting a higher voltage for the plate supply. But you'll be safe.

One wild idea I've wondered about is whether you could take two identical switching supplies (the local surplus store had plenty at one point of non-PC switchers) and used one normally, but take the transformer out of another one and use it in reverse (as above) to get 120VAC or more. It may not work because it will provide the wrong load to the existing switcher, you will have to select one output winding and remove the rectifier and filter capacitor, but if it works it will give you isolation at maybe a cheaper cost than two traditional transformers.

If you want a "real" transformer, keep an eye out for big tv sets. I imagine most tube-based sets have already been discarded, but you never know. They used to be considered a good source of transformers for projects, either as is or rewound to get the most desired voltage.

If you have access to a good size hamfest, a transformer shouldn't be a problem. Somebody will have tv transformers they've scrounged over the yearss, or something else.

Years ago I ran a tube 2meter FM rig that was originally intended for mobile use. I took out the vibrator, and fed the pins where the vibrator's output normally went with a fairly decent 12V transformer that was on hand. The rigs transformer probably got hotter than it should, but it worked. So there may be life in those old transformers and I can't imagine anyone putting a high price on them now. I find it hard to picture someone using one of those rigs in their car nowadays.

Or, get one of those transformers and build a circuit on the primary that acts like the vibrator but which is mechanically quiet. Run it from a switching supply and you've got your power supply.

I heartily second that advice!

Another inexpensive source of isolation transformers is your local electronics surplus store. Lots of test equipment, transformer-type power supplies, and other gear use transformers which have a dual primary. This is so the same transformer can be used in countries having 120 or 240 volt power -- the primaries are connected in series for 240 and parallel for 120. Look for a 120/240 volt selector switch on the rear panel as a clue, although the primaries are often hard-wired when there are separate models for different countries. You can use these two windings as an isolation transformer. Who knows -- you might even get something useful from some of the other windings.

Dear R2/T2, miniR2 and Phasing DC fans,

Jan (G0BBL), Alan (G7PUB) and Steve(G0XAR) would like you to visit their QRP2000 web site at http://www.stevef.demon.co.uk/qrp2k/qrp2000home.htm. It describes our progress so far on building a multi band transceiver based on the well known KK7B R2/T2 modules coupled with BPF, PA, LPF modules from Hands electronics. It covers top band to ten meters, USB,LSB and CW. Our contribution is our own design dual DDS VFO coupled with a PIC based controller. This overcomes the difficulties of generating perfect phasing over a wide range of frequencies using analogue techniques. The result is the effective multi-banding of what, in the past, has largely been considered as a single band design.

We hope it is of interest to the QRP community.

Jan, Alan and Steve AKA the QRP2000 team.

That'll work, depending on the current you need, and assuming that if you're wiring the secondaries as your 110V primary, the original primary is rated for a high enough voltage.

Diode doublers don't have an especially good reputation for providing a stiff supply, and you may find that the series resistance of the primary windings limits the current you can put in. So -- it might work and it might not. I've found that most of the time, big iron is pretty forgiving (but my Fluke DVM is NOT).

Happy experimenting, and take the usual precautions.

What if you wanted to play the flute, but a law required that you learn how to play the harp before you were allowed to play the flute?

What if you didn't like the harp and only wanted to play the flute, and other flute players called you lazy for not wanting to waste time learning an instrument you had no intention of ever playing?

Some people want to get into the hobby of radio to talk on the radio. They have no desire to use morse code. How silly it would be to waste the time to learn morse code, only to forget it once one has the license to go ahead and use voice.

Only people who intend to USE morse code should learn it.

Re: Radiotron Designer's Handbook

Hi,

The 'Radiotron Designer's Handbook', edited by F. Langford Smith, is one of radio's classic texts. It was named after the Australian Radiotron Valve Factory (Amalgamated Wireless Valve Co.) but was distributed in the U.S. by RCA. I have a 1941 edition with the RCA logo on the cover.

It went through several editions and in the U.K. metamorphosed into 'The Radio Designer's Handbook'. It was republished last year and should yield to a search on amazon.com (or amazon.co.uk).

I think the control transformer idea will work better than a regular plate transformer would. All the power supply transformers (low voltage and most likely the same for the HV ones too) I have seen spec's for have as much as a 10 to 20 percent drop in output voltage from no-load to full-load. This is even before we talk about how well a voltage doubler will regulate from no-load to full-load. Industrial control transformers seem to be about 10 times better than your typical DC power supply transformer as far as voltage regulation goes. It really has to be or there would be BIG problems for any of the equipment connected to it if you think about.

All of the HV DC plate supplies I have seen for tube amplifiers look way too light on filtering. A circuit simulation I did showed for a full wave voltage doubler using 250 UF capacitors giving a 2KV output voltage (720 vac input) regulated to with in a few percent from no-load to full-load (about 8K for a 500W supply, good enough for a 4CX250). The ripple voltage at full-load looked to be about one percent (peak-to-peak) of the output voltage.

I am selling a pair (2) type 811-A tubes. Both are RCA, in original boxes. One is date code 58-30, the other is date code 61-17. I am CERTAIN that the 61-17 is NOS, however the 58-30 has two small nicks on the base, so I canï¿½t say for certain that it is NOS. I WILL say that it looks ï¿½like newï¿½. I bought both of these from the same retail source, at the same time, and both test fine (tested within the past week). I have not PERSONALLY used these tubes...I purchased them for my repair parts stock. Theyï¿½ve been sitting around my shop for years, and itï¿½s time to find them a home somewhere.

$50 for the pair of 811-Aï¿½s
========

I am also selling an assortment of five (5) 807 type tubes. All have been tested recently, and they all test strong. All are NOS, in original boxes (5933 in original white box).

2 - 807 - RCA - brown base, date code 5-43
2 - GL807 - GE - brown base, date code 57-04
1 - CHS-5933/807W - Sylvania - brown base

$40 all for the 807ï¿½s
========

Interested? Please respond by email.

Regards,
Tom Mitchell

I b'lieve full name is/was "Radiotron Designer's Handbook", think it was published for RCA and sometimes called the "RCA Radiotron Designer's Handbook". I used it for tube design ideas and formulae in the mid 60's and it was GREAT. There's gotta be some still around in libraries.

I used the soundmodem linux kernel driver at 1k2 without a problem, so you might give it a try. You only need about 4 to 5 components to trigger your radio PTT ... Check the AX.25 HOWTO on Linux Documentation Project (LDP) you can reach there from www.linuxhq.com , or sunsite.unc.edu/pub/Linux

Cheers,
Nuno Sucena

Hello,

i would like to experiment with microwave circuits, 1.2GHz ,
2.4GHz and possible higher. I am able to make reasonably medium quality
PCB's (using UV methods) but 0 experience with designing with that kind
of circuit at that frequency. I was thinking on buying all the books from
ARRL with uwave on its title , what do you think? Other important stuff,
do you know some cheap, small quantity, european component distributor that
i could use on my projects?
And about PCB, how can i know the dielectric and other important
characteristics to make microstrip?

Thank you for your help

Hi, Bill and welcome to the hobby!

There are several versions of TNC: the Baycom unit is pretty much a
minimal modem and uses software in the computer to handle the packet
protocol and channel management. There are also units that you can
plug a terminal, or a computer pretending to be a terminal, into and
get on the air. There is also the sound card based type, which I
confess not having any experience with. My guess is, unless you are a
confirmed computer jock and can deal with driver and interrupt issues
readily, that you will get on the air fastest with a packaged TNC like
the KAM or MFJ for around US$120. Run your computer terminal emulator
or use the software that comes with the TNC, or look for some of the
really very good TNC interface software you can get from ham
entrepreneurs such as KAWIN. Most logging programs have support for
TNCs as well.

73 es cu on the air!

Would someone please explain for me why attaining good isolation is important here for considerations of *safety*? Insulation and proper grounding rather than isolation would seem to be the central safety concerns. Intuitively, and on examining a Hallicrafters S-120, and a few of my other radios that are AA5/no xfmr./selenium rectifier designs, I can't figure it out. With an isolation transformer, AC voltage in = AC voltage out; I don't "get" what it is the iso-xfmr. accomplishes. I don't understand very well the fundamental purpose and principle of isolation transformers and isolation in general, so I suppose that is why I am having trouble understanding the safety issues in this application. Thanks for your patience and insight.

There was something about that post that made me think it was one of the occasional beer-making posts we get here from time to time. I'm not quite sure what it was that made me think that. Maybe it was the "why post and wait for an answer" since unlike a lot of newsgroups the questions ask aren't often common.

4619. Re: Glowbugs & transformer-less power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-04-30 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <3729FFF7.EFEC331A@teleport.com>
Source record: 70706

Sure.

Here's the problem. One side of the A.C. mains is connected to the Earth, and the other side is 120 volts or so relative to this. If your house is wired and grounded properly, the side connected to the wide slot of the socket is the one connected to the Earth ("neutral"). It should be safe to use a polarized plug (having one blade wider than the other so it can't be reversed in the socket), and connect the neutral wire (the one going to the wide blade) to the chassis of your radio. But it ISN'T safe, because there are a lot of houses out there which are NOT wired or grounded properly, or where an outlet has been added or replaced by someone who doesn't know how to do it properly. If you connect one side of the A.C. line to the chassis, and the wiring is reversed, the chassis is then at 120 volts relative to the Earth. Touching the radio while simultaneously touching any grounded object like a faucet, metal appliance with third-wire ground, etc., or while having any other electrical contact with the Earth can be fatal. If you have a three-wire system, you can get some protection by connecting the third, ground, wire to the chassis also. But then if the other two wires are reversed, you'll directly short-circuit the mains. And you have to be sure that the third wire is also correctly installed and connected.

Some power supply configurations, like ones with a bridge rectifier, don't require a connection from either side directly to the chassis. But these result in a sizable voltage from the chassis to the Earth regardless of which way the plug is turned around (assuming one side of the output of the bridge or other circuit is connected to the chassis).

There are a couple of ways of dealing with this. One way is to "float" the chassis, and not connect either side of the mains or the power supply output directly to it. This was frequently done with AC-DC radios. But it's very desirable to use the chassis for shielding and for an AC ground in the radio, so the mains wire was usually connected to the chassis through a capacitor. The idea is that the capacitor would be a good conductor for RF but have a high impedance at 60 Hz. One problem with this approach is capacitor reliability. It's common to have very high voltage spikes (well over 1 kV) appear on the AC mains, and the capacitor has to withstand these without its leakage current increasing significantly. Also, a capacitor that's effective as an RF conductor at the common IF of 455 kHz and at the lower end of the BC band doesn't have as high an impedance as you'd like at 60 Hz. Most people of my generation recall getting a "tingly" feeling when touching a radio if the plug was inserted one way, but not so much if

it was turned around. (Most radios, as one poster mentioned, came in plastic boxes with plastic knobs to make it difficult to physically touch the chassis.) My first receiver was a Hallicrafters S-38D, which was a transformerless unit in a metal box. I nearly burned the house down by connecting the chassis to a good ground. When I turned the radio on, an arc formed across the power switch, which extinguished only when I raced down stairs and threw the circuit breakers (an event neither I nor my parents ever forgot).

The best way around this is to connect the radio to the mains through a transformer. You can then safely connect one side of the transformer secondary to the chassis (or have it at any other potential relative to the chassis), connect the chassis to Earth via the mains third wire or a grounded antenna, and not worry about killing yourself from touching the chassis.

One other word of advice for those of you playing with fire-fets: Keep one hand in your pocket when you're poking around in the radio's insides.

Richard Karlquist wrote:

> Secondly, get a low tempco crystal, not a
> microprocessor grade crystal.

Good advice (as usual) from Rick. Specifically, I know that you can get AT-cut crystals rated at max +/-2ppm over a fairly wide temperature range. Something like 0C to 55C sticks in my mind, but I may be wrong about that. Check out International Crystal, esp. http://icmfg.com/tech.html. Tight control of the angle of cutting the crystal is required to guarantee low tempco, so expect to pay for it.

Cheers,
Tom

Can someone describe the circuit that composes those little (3"x3"x4") 240/120 travel transformers you take along to use your 120V appliances when visiting countries with 240V AC mains? I had an idea to use one in a HB power supply for running a little homebrew tube receiver. What kind of isolation and current rating do these puppies have?

I probably shouldn't be answering this since I'm in the same position you
are: a newcomer trying to get started. But I have seen someone using the
Baycomm TNC you describe that he was fairly pleased with it.

The most recent QST has a very interesting article about a new digital
mode called PSK31, I think. It ran through a sound card and software was
free. I'm looking to try out here. If anybody has any recommendations I'd
be glad to hear them.

The small ones, 50w or so, are transformers. The larger ones that will
operate a hair dryer, etc., are sometimes only a diode in series with
the line or the equivalent. The former have good isolation, the latter
none. Your little radio will surely run on a 50w transformer, but be
sure that the unit you use is really a transformer.

Throw an SWR bridge in between the SB200 and the FT1000MP and the SB200 into a dummy load. With the MP throttled way back (use full sensitivity on the SWR bridge and adjust MP power out for full scale forward power on the bridge), adjust the coils for each band. Don' t forget to run the MP **without** the built-in tuner :)) Also don't forget to retune the SWR bridge forward power for each measurement.

If your SB200 input coils are *way* off, you might need to use an old transmitter for this, as the MP will likely see the high swr and shut itself down.

The "Radiotron Designer's Handbook" went through 4 editions, in multiple printings.

I believe the 350 page version is the 3rd edition.

The 1000+ page version is the 4th edition.

The 1498 page, 1968 printing of the 4th edition was reprinted by Newnes as the "Radio Designer's Handbook", ISBN 0-7506-3635-1. It is also available on CDROM from Old Colony.

Yep:

I have received some 32 Channel 40 Watt Motorola Maxtracs. (16) Pin Style logic boards. These radios are in Excellent Condition. Comes complete with Mike, Bracket, Mounting Screws, and I can have a few channels programmed for free.

Asking $375.00+$8.00 for shipping and handling

Terms:

Acceptable PrePayment in the form of a Postal Money Order (if you desire immediate processing) or a Personal check is A-OK too if you do not mind a short delay do to bank processing

I would like to know how CW maintains this "level of operator
competentancy"? While "we" are debating CW, the Internet, cable modems,
sat. phones, cell phones are passing us in technology.

Mike (KD4LLA)

For the people who like peace and quiet: a phoneless cord <grin>!

The longer Bill Clinton stays in office, the more we pay.

Our justice system pays because he has opened the door for millions of us to play games with the notion of telling "the whole truth" under oath. Our military personnel pay because they have to carry out their duties while grappling with questions regarding the motives of their commander in chief. Our national intellect pays because, with his myriad verbal contortions and willful deceptions, the president has become little more than a walking, talking insult to our intelligence. Finally, the taxpayers pay because, in his efforts to keep "looking presidential" and "doing the work of the people," he is creating more new programs and growing the government.

Haven't we paid enough already?

See my web page at http://www.alaska.net/~mdickman/Index.htm

>self limit the current to 150 Ma?

Yeah, it'll work fine. It might take *weeks* to get the battery to full
charge, however. You might need a DC-DC converter to get enough
voltage for a topping charge. But if you don't care about that, and
there's little reason you should, then just connect the solar panel
to the battery through an isolation diode (Shottky or Germanium
preferred) and enjoy.

The problem here is that the 150 mA rating of the solar panel
is likely the short circuit current rating. Voltage won't be above
14 volts when you draw that much current. So you wind up with
a very slow taper charge as the battery nears full charge.

I have exceedingly limited knowledge on this topic so be so advised.

I believe a 5/8ths type requires a ground plane. Ground it to an array of
ground wires buried or make a 4 prong ground plane of equal lengths that are
same as the vertical radiator.

I had always assumed that these were true two winding transformers, but recent tests showed most of them to be autoformers. So take your ohmmeter and check continuity between primary and secondary.

Maybe a couple or three husky AC wall warts back to back would be a better choice. A 24 volt 1 amp is 24 watts, and one driving two more backward whose original primaries are in series would provide 220 volts at near 100ma. 200 ma if you use 4 of them.

>about that. Check out International Crystal, esp.
>http://icmfg.com/tech.html. Tight control of the angle of cutting the
>crystal is required to guarantee low tempco, so expect to pay for it.

AT cut crystals have cubic tempco symetrical about approx 27deg C so the
best room temp performance would be to specify say +3ppm +-10C both
sides of 27C.
Really your best bet is to temperature control the crystal at just above
the maximum ambient. If you plot the crystal freq from room to +60 and
are lucky it may even be that the crystal will go through a turnover ie
a point of zero temperature coefficient. That will be the best temp
however it may be that the freq will be too far off to bring to nominal
by trimmer. As already said the temperature coefficient of the logic osc
circuit will be then worse than the crystal.
PS Ive got some 16.384MHZ ovened crystal reference standard oscillators
for sale uk pounds 50 , I bought them on the surplus market , they are
parts in ten to the eleven per deg c and parts in ten to eleven per day.
Can be used to lock the counter crystal to the same stability.

Source record: 70644

Felix,

There are many variables to consider when choosing an Oscar setup.
There are a couple good groups out there, rec.radio.amateur.space, and
the AMSAT BBB. amsat-bb@amsat.org.

I posted a FAQ on listening to FO-29 with a scanner or handheld on both
of those groups this morning.

Most of the satellites are considered weak signal, so you will need some
gain (directionality) to work those birds easily. There are a couple
exceptions:

AO-27 is a LEO (Low Earth Orbit) FM bird. It has an uplink on 2 meters,
and a downlink on 70 cm. I can work it with a handheld and a gain
ducky. Of course a small handheld beam like the Arrow makes it easier.

Another bird, which is easy to work is RS-13 (Radio Sputnik 13). This
bird is currently in mode KA. It has a 15 meter, and a 2 meter uplink,
and comes back down on 10 meters. Of course, with most of the birds,
you will need a rig capable of full duplex operation, or two rigs.
Since the transponders are linear, you MUST be able to hear your own
downlink. I work RS-13 with a 2 meter and 10 meter turnstile. They are
both fixed antennas with modest gain.

Check out the AMSAT web site. There are many good articles on
satellites and equipment. Find that site at: http://www.amsat.org.

Also, lurk on the rec.radio,amateur.space site. Once the code/no code
flame wars are over there, it will return to being a fine group.

Good luck and let me know if you need any help. Satellite operation is
a very good use of amateur technology and spectrum.

I'm Roberto IK2RND , I have realized a replacement board for EX-314 MEMORY BOARD installed in these Icom rigs :
IC-745 IC-751 IC-751/A ICR-71A/E IC-271 IC-471 IC-1271.
My board called EPROM/RAMBOARD definitely solve the problem related to the lithium battery fails. When battery fails the rig stop to work and you need to send your radio to the Icom service center to replace battery and reprogram the board.
Data in the my board are stored in an EPROM chip the RAM is used only to store the 32 memory channels.

73, Roberto IK2RND

Have the following Linear AMP parts for sale, will not split up, all or nothing:

1: Peter Dahl plate transformer: Primary: 115/230 VAC Secondary: 1250 VAC @ 1.5 Amp CCS (this produces 3100 VDC under load in a voltage doubler supply - It's a big puppy!)

8: 1500uf @450V Computer Grade Filter Caps

2: 4CX1500b Eimac Tetrodes (good medical pulls)

1: 7.0V @ 15A(?) filament xformer (will have to be dropped down to 6.0V to use with the 4CX1500b)

1: Socket for 4CX1500b

1: Dual Squirel Cage blower fan for cooling, good pull from military equipment.

1: Copies of several plans for linears that use the 4CX1500b (including Collins linear)

Asking $400.00 + shipping for the lot.

4668. Re: ** Help identify a Capacitor **

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-02 00:00:00 UTC
From: Barry Sloan <ve6sbs@home.com>
Message-ID: <823X2.2672$NC4.4652@news.rdc1.ab.wave.home.com>
Source record: 70655

If there are no polarity markings, such as black band around one end, then check the lead connections. Negative connection will be to capacitor can and positive connection will be through insulating plug at open end.
In photo it appears that there is a black band at each end, however lower band may just be a shadow in photo. If there is only one black band (top end in photo) then this is the negative connection.
Another way is to simply apply power to the circuit and measure the DC voltage polarity on the capacitor.
Finally, if this is a coupling capacitor, don't overlook the possibility that this could be a non-polarized electrolytic capacitor.

Good Luck! Barry VE6SBS

You are right. But they are different editions. The 350 page is the
3th, the 1398 page is the 4th edition.
The Radio Designers Handbook and the Radiotron Designers Handbook
are the same. The first is a British edition, the second an RCA/US
edition. A reprint of the British edition of the "Radio Designer's
Handbook" by F. Langford-Smith. It is still available as a copy of the
original 1953 4th edition with 1498 pages at
'Reed Educational and Professional Publishing Ltd"
ISBN 0 7506 3635 1 (1997) for a price much lower than the today's
price for an old original (Ebay) copy.

> What do you mean saturate? Can't you just use a microwave oven
> transformer off the mains? Why?
> Vy 73 de Angel HB9SLV
==========
Microwave oven transformers are meant to operate for relatively short
periods only.
The core laminations are welded together ....eddy currents
.........core gets hot if used for longer time
First test transformer without load for say 30 minutes.

One end of the HV winding is always connected to mass (earth)

It might be worth trying to use 2 identical transformers as 1
transformer with an earthed centre tap and
2(strings) rectifying diodes (double phase rectification) Each of the
2 transformers rectifies half a cycle. But again first test the
transformers without load whether they don't get hot.

Even if the no-load test is satisfactory, do not use a single micro
oven transformer with a bridge rectifier.

>
> Bill KU8H

Hi Bill OM,

I heartily agree. To wit:
I have been on the air, in contact (linked) with another station on
40M AMTOR, when the cat walked into the (ugly style construction)
transmitter circuit of my homebrew 40W FSK/CW rig, and shorted out the
VCXO, which shorted the B-E junction on the 2N3904 osc transistor.
Real-time, without dropping the link mind you, a hot soldering iron
applied (while the circuit was energized), resulted in an easy component
change and fix. The op on the other end never knew about it, until I
told him. FUN stuff.
I have found that purchasing new ham gear does nothing for me at all,
except waste my money. Been there, done that.
I think I have maybe $25 in the complete transmitter, and $12 of that
is for a crystal I purchased new. I consider $10 to be a major expense
item for rigs.

You can get a good start buy getting a copy of the ARRL Handbook, a copy of the ARRL UHF/Microwave Experimenters Manual and a copy of the ARRL UHF/Microwave Projects Manuals (Volumes 1 and 2). All three of these books have good design and construction info in them.

I would also suggest that you check out the following URL's too for ideas.

For tube amps ...

Good design article for screen and control grid power supplies.
I would read through his material BEFORE building anything.
http://www.ifwtech.demon.co.uk/g3sek/

Same sample 50Mhz amplifiers.
http://user.itl.net/~equinox/kw.html
http://user.itl.net/~equinox/amps.html

Good for tube data sheets.
http://www.svetlana.com/docs/tubeframe.html

Super design article for a 2M amp!!
http://www.svetlana.com/docs/TechBulletins/technoteNo42.html

Good general design points.
http://www.svetlana.com/docs/TechBulletins/appnoteNO.4.html
http://www.eimac.com/cf.htm (This will be a good reference when done!!)
http://www.winternet.com/~biro/articles/VTspice.html
http://duncanamps.simplenet.com/software.html (PS cal's work for V/UHF too.)
http://duncanamps.simplenet.com/technical/technical.html (May find something useful.)

Source for Plate Power Supply transformers.
The price maybe high, but at least you can get one if you
can't get it anywhere else.
http://www.pwdahl.com/

Source for tubes and other amplifier parts.
http://www.rfparts.com/index1.html
http://www.rell.com/edg/bcstline.html
http://www.burle.com/

Now If you want solid state ...

http://www.ibelings.com/n4ip/mrf157.html (Sample 1KW wideband amp to 6M)

Good source for transistors.
The test circuits serve very well as the base for a complete amplifier.
These

test circuits also include a parts list and PCB artwork too!!
http://mot-sps.com/sps/General/chips-nav.html

You can call Motorola and use their fax back service to order the following
application notes which you will find useful.

AN-791 "A Simplified Approach to VHF Power Amplifier Design"
AN955 "A Cost Effective VHF Amplifier for Land Mobile Radios"
AN1037 "Solid State Power Amplifier 300W FM 88-108 MHz"

Good Luck

Connecting the inside of the secondary winding to the core/ground is mostly a feature of the circuit in which it was designed to be used, in which the magnetron itself acts as one diode in a voltage doubler. Unfortunately that is not applicable to power supplies for normal vacuum tubes.

The problem in using the transformer in the more common amateur rectifier circuits is that the inside end of the secondary is not significantly insulated, so you can't expect to be able to lift that connection off the core and use it in a full-wave bridge - the voltages involved are too high. (OK, you may be lucky, but don't plan on that.)

Using two identical transformers in a bi-phase (center-tapped) configuration is workable, but don't expect as much output current as you'd get from the same total weight of copper and iron in a single transformer. This is because each individual transformer is acting as a half-wave rectifier, with the rectified DC flowing through the secondary winding. This magnetises the core and increases the risk of saturation. It's not like a normal center-tapped winding on a single core, where the magnetization reverses on each half-cycle so there is no DC component.

For current metering in the negative lead, you should be using a large protection diode for the meter, and that will make sure that the voltage from the B-minus lead to chassis is always less than 1V. In those circumstances, it's perfectly OK to lift the inside end of the secondary winding, and leave the core grounded to the chassis.

Regards!

I have used with success down to 10 Mhz a TV detector MC1330 which is
now obselete but some wholesalers still cary the part. This device has a
limiter and a multiplier. The limiter requires a resonant circuit at the
frequency of your IF. You can also make a good envelope detector with
any FM detectors like the CA3089 or similar IC's. The IF signal
must be applied to both the limiter input and the multiplier input
(also called product detector) The phasing between the limiter input and
the multiplier input must be in quadrature. Also, the signal to the
limiter must be stronger than the signal to the multiplier input. See RF
Design Magazine
July 1994 page 44. Good Luck! Ve2AUC

There are usually two magnetic shunts between the top and bottom
windings. They consist of bundles of laminations abt. +- 1cm sq.
and should be carefully knocked out with a pin punch or similar.
They are intended (I understand) to limit saturation. By this
they also limit the output.

Hope that's clear! :-) Look at one and you will see it
immediately. I missed it first time round until it was described
to me.

Need to purchase two new HF Xcvrs for an EOC located in a waterplant (utility) with high RF noise levels.

Which DSP system is superior for noise suppression... IF or Audio?

Am looking at the ICOM 746 and Kenwood 570 models... any experience or advice?

Message-ID: <ppirotte-0305990829520001@rmnmac5.ulb.ac.be>
Source record: 70666

Does anybody know the characteristics of LB-135 and LB-206 VCO coils (IC765)?
What are their nominal values (is it respectively 0.135 nH and 0.206 nH)?
I'm also interrested by any technical information (characteristics) about
1SV50E and FC52M (varicap diodes).

As this kind of VCO work pretty well, I'd like to use a very similar
design in my homemade transceiver.

Thank you in advance

Pascal

Thanks for all information supplied by several OM. I wasn't intent on spending more money, but just hoped to somewhat compensate the drift that occurs around room temperature using a simple home-brew scheme. I know I can order new TCXO's for a lot of money. The counter works to 3 GHz, but I won't go that high and my accuracy requirements are modest. My only calibration reference is short-wave reception of standard frequency stations anyway.

The counter module is a kit and has been designed with the oscillator in the PIC. I believe I could use an external oscillator, but in fact the seller/designer originally said that it would require reprogramming.

The time-base oscillator in my counter is 16.000 MHz. I do have a salvaged 4 MHz Xtal in it's own oven (octal base), but it's not operational and it cannot simply replace the 16 MHz oscillator, of course. A cheap 16 MHz TXCO would be nice ;-)

Probably the simplest antenna would be made from a piece of RJ58 coaxial cable. Measure down about 21" from one end and make a mark. Start stripping the outer insulation back until you reach your line, being careful not to damage the inner shield braid. Carefully cut and remove the outer jacket piece. Next you need to fold the shield braid over itself, beginning at the end, until it covers the outer jacket BELOW the 21" point. This step is not easy, but it can be done. When you are finished, put some nail polish or bathtub calk on the spot where the inner wire emerges, and use plastic electrical tape over the shield braid to protect it from the weather. Tape the whole thing to a piece of wood or PVC pipe for support. The inner conductor is your antenna, and the shield braid becomes the counterpoise. Not surprisingly, it's called a "coaxial" antenna. It's similar to a ground plane but the "radials" end up folded all the way down.

>> Vy 73 de Angel HB9SLV
>====================
>Microwave oven transformers are meant to operate for relatively short
>periods only.

Up to at least 60 minutes at 1000 watts for most models. Some have
timers that allow them to operate for 99 hours and 99 minutes at full
power. That's longer than any but the most long winded ham should
be key down. The transformers in microwave ovens often benefit from
the fan cooling of the magnetron, but they are essentially CCS rated
for continous duty at the oven power level. So they make excellent
transformers for heavy duty amateur equipment up to 1 kW. (If you
want to run them at 2 kW PEP, you may have to watch the duty cycle
a bit.)

>The core laminations are welded together

No they aren't. If they were welded together, they wouldn't be
laminations any longer, and their eddy current limiting value
would be nil. (That's why transformer cores are laminated,
to break up the shorted turn they would otherwise form if
they had continuity with each other.)

>....eddy currents
>.........core gets hot if used for longer time
>First test transformer without load for say 30 minutes.

Or for 30 days for that matter. With no load, only the magnetizing
current is drawn, same as any other transformer. Every transformer
from the lowliest wall wart to the heaviest pole pig is designed to
operate at no load indefinitely. The magnetizing current should be
less than 10% of the full load current, and is usually much lower
than that. No unloaded transformer should get more than slightly
warm to the touch, no matter how long it is powered up.

The main difference between microwave oven transformers and
any other transformer is that they employ magnetic shunts to limit
the current to the magnetron in case of an arc-over. These shunts

allow part of the magnetic flux produced by the primary to bypass the secondary. Thus the primary will saturate at high current draw and limit the maximum current that the transformer will provide to a load. Most of these transformers have two shunts. They are held in only by the transformer varnish. You can tap them out with a pin punch and hammer, leaving the transformer to behave like any other conventional transformer of its size.

If you don't do this, while the transformer will be able to supply a 1 kW continuous carrier signal, it won't respond properly to the peak demands of a signal with a varying amplitude, IE full power SSB. It will current limit on peaks, which will cause the amp to flattop. Removing the shunts removes this limitation.

>One end of the HV winding is always connected to mass (earth)

Yes. That's a good safety feature, but it can be a nuisance if you want to use a current metering shunt in the low side of the HV supply. There are a couple of easy ways to deal with this. One is to mount the transformer on an insulating material. The other way is to do minor surgery on the transformer to disconnect the lead from the transformer frame and bring it out in the ordinary way. Either method is satisfactory, but if you do decide to insulate the transformer, you have to enclose it in the HV cage to prevent accidental contact with it by the operator.

These transformers are an excellent bargain. They can often be had for free from defunct microwave ovens. After you remove the magnetic shunts, they make fine power supply transformers for high power amplifiers. Microwave oven service is a much more demanding duty cycle than that of most amateur amplifiers, so these transformers serve admirably.

>Which DSP system is superior for noise suppression... IF or Audio?

IF filtering is preferred because it is inside the AGC loop. But DSP isn't
the correct solution to impulse type noise problems. Late stage DSP is
usually ineffective against that sort of noise. For that, you need a blanker
that's before any narrow filtering in the receiver. Any narrow filters will widen
the noise impulse and cause much greater signal degradation when the noise
impulse is removed. So what you really want here is a receiver with a good
noise blanker located right after the first mixer and before any narrow filtering.
That's a separate issue from any filtering it may employ at the IF or at audio.

Yeah Bill I realize now that a savings in money is not reality. But like I mentioned ans as you also have mentioned the satisfaction of building your own is wonderful. I ordered the 2meter kit from Ten Tec. When I first started tolook into this whole kit business I noticed that saving money does not really happen. I am very excited to be building the kit. I appreciate your help and input Bill...73' joseph merfalen

Hi Gary...

">So what you really want here is a receiver with a good noise blanker located right after the first mixer and before any narrow filtering. "

Unfortunately, there is so much machinery at the waterworks that I have no way of telling how much is impulse (ignition,etc) versus other noise (motor brushes, loose connections, etc.) I do know that our old TS430 noise blanker is totally INEFFECTIVE!

I'm in the processof trying to attack the problem by increasing antenna heights and relocating antennas.

There's so much machinery around that a widespread noise suppression program at the sources would be pretty costly, so I'm trying to pinpoint only the major noise generators for corrective action.

What HF xcvrs do you recommend for their superior noise blanker performance or combination NB + DSP results?

See the description "radio" in the newsgroup name? What do you think it means? Homebrew has meant home-built radios and radio equipment since before Charlie Pappazian was in diapers.

4713. AC Outlet Testing (was Re: Glowbugs & transformer-less power supplies)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-04 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <372EC776.1006A32F@asu.uswest.net>
Source record: 70600

Thanks, Roy, for the patient and thorough reply, and everyone else who responded. I am now thoroughly put off the cheapskate idea of trying to build my little glowbug projects sans transformers. The one-hand-in-back-pocket rule is one worth following in all cases.

Now, a more general and corollary question about AC house wiring: what is the proper method of testing outlets to determine if they are wired correctly, especially with respect to the third/ground wire? RS and other retailers sell an overpriced rinky-dink tester of dubious value. I'd rather learn something and save my money.

I am almost certain that with the right procedure and a good DMM (or a simple and inexpensive home-brewed tester) I should be able to get more information of a higher reliability, but the question remains: what am I looking for, and how to acquire that "what"?

4714. Meaning of V.C.T.?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-04 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <372ECA73.7FDF937A@asu.uswest.net>
Source record: 70601

I keep coming across the abbreviated voltage rating "V.C.T." with respect to the secondary/output of power transformers. Can someone please spell this abbreviation out for me and explain what it refers to?

Also, why are power ratings described in terms of volt-amps (V.A.) instead of watts in some components?

OK thanks Pat for the advice, 73 de Colin.

pat <1126@nethawk.com> wrote in message <372CBDC8.E261BFA5@nethawk.com>...
If you can power the circut up see which way the voltage polarity is with a meter. Measure the voltage across the cap and see which side is pos and neg. If not able to power the circut up look for diode or transister polaritys in the surounding circut to give a clue.

4716. Re: Meaning of V.C.T.?

From: Larry Gauthier <larryg@ismi.net>
Message-ID: <372eeb96@news.ismi.net>
Source record: 70603

Will:

V.C.T. stand for Volts Center Tapped, which means that the secondary of the transformer has a connection that is mid-way (electrically) between the two outputs. A transfmormer labeled 1000 vct has a secondary with three connections: 1000 volts end-to-end, or 500 volts from either side of the center tap.

Back in the days of vacuum tube rectifiers, the center tap was generally tied to ground, and two tubes provided full-wave rectification - one on each leg. That can still be done today with two diodes, or you can use a "full-wave bridge rectifier" four-diode combination which would ignore the center tap. Generally, a VCT transformer will provide you with more flexibility in designing the output voltage from a power supply (this may or may not be on any consequence to you...).

Regarding the terms V.A. - that term is far more prevalent in the electric and power industry circles, where industrial equipment is rated in VA of KVA (Kilo volt amps) terms. Why? Cause that's the way they've always done it... ;-)

Source record: 70605

Watts only equals VA when the voltage and current are in phase. VA (Volt Amps) is the apparent power delivered to the load while Watts is the true power. Because the nature of the load (and therefore the phase difference) is often unknown in power systems, the term VA is used.

The formula Watts = voltage times current only applies when the voltage and current are in phase but VA = voltage time current always applies.

4720. 440 Mhz devices & chips

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-04 00:00:00 UTC
From: markus <anonymous@remarq.com>
Message-ID: <EfEX2.1917$4S.1237817@WReNphoon3>
Source record: 70607

I'm looking for information about chips / devices in the 440Mhz range for some
homebrew projects. I know there are car-keys, remote temperature sensors
and other devices out there.
These use low-cost transmitters and receivers and I'd like to find a supplier
for the chips used within for some applications.

Can somebody help me out with some company names of manufacturers of
such chips ?

Thanks Markus

Source record: 70608

This whole deal brings up an important point..

We need to check the list of groups an article is being posted to before posting it -- *especially* if we're replying to an existing article. If that had been done in this case, I suspect only one or two of the beer-related postings would have ever made it to this group. I'm not picking on the beer people here, posters on the various rec.radio.amateur.* groups are about the worst I've seen about cross-posting.

When you (generic you) reply to a posting, check the To: line and get rid of any groups that don't seem relevant to what you're saying.

It would be great if newsreader software would refuse to post articles to multiple groups unless the user manually confirmed each group...

Joseph Merfalen wrote:
> I am totally new to HAM radio and I am very curious to what exactly a
> wire antenna is. Is it exactly what it says? A Wire?

Yes, that is exactly what it is!

It's really a generic term, which covers several types of antenna -
dipoles, long wires ("long" meaning a substantial fraction of a
wavelength), curtains, etc..

> Can one use a wire antenna on his/her HT? What are the procedures to makinga wire antenna
> for a 2 meter hand held, if that is possible. Any input is grately appreciated

Certainly. My first 2m antenna was a dipole, soldered directly to the
coax connector & lying flat on the kitchen table. Worked Buffalo, New
York on simplex (from Milwaukee!) on that antenna...

The simplest wire antenna for a HT would be a dipole. This is a flat
1/2wavelength piece of wire, cut in the center. Hook one side of the
cut to the center pin of a coax connector, and the other side to the
outer shell of the connector. (if you want, you can hook it to a length
of coaxial cable instead, and put the connector on the other end of the
coax) 1/2wavelength at 2 meters is roughly 38" -- I'd make it a bit too
long, and then snip identical amounts off each end until the SWR is
lowest. (or the radio's RF output meter tells you you're getting
maximum output power)

Try fttp://www.linxtechnologies.com

They have chips, boards, prototype systems, whatever you need. The chips use SAW technology, so are only available in certain frequencies, but it seems to me I saw one on 432Mhz.

Please forgive me if this is a stupid question, I'm a homebrew newbie.

What would be the implications of using 3 small washers stacked instead of a toroid ferrite core? It seems that they would be *similar* in nature, but I am sure that there is a good reason for not doing this.

Any discussion would be welcome.

Thanks
Kelly.

None of us were born knowing everything we know now. Most of us got our knowledge by asking a lot of questions. You are simply where we were before "enlightenment." You shouldn't be ashamed to ask any question, though you should be prepared for the occasional wisecrack answer.

Having said that - washers are made of steel. Ferrite and steel have little in common. Ferrite is a composite material having certain magnetic properties that make it unique. If you just want some ferrite cores to experiment with, give me an idea of the frequency range or application and I will send you some samples - no charge.

A couple of manufacturers of such things are;

RF Microdevices (receiver, transmitter and transceiver ICs) -- www.rfmd.com
RF Monolithics (receiver, transmitter and transceiver modules) -- www.rfm.com

Some are fixed-frequency (433.9 seems to be popular) and some are selectable with appropriate crystals/resonators.

From: Mark Nelson <mnelson@pedinc.com>
Message-ID: <372F3E4F.30343254@pedinc.com>
Source record: 70617

Where can I find info about the small antennas used in things like pagers? I know pagers work at VHF/UHF frequencies, but even so the antennas in them are quite small. I have need for very small antennas for a short-range (a few meters) wearable data link at 70cm, and haven't found much data on them so far.

Also, what sort of measuring equipment can I buy or build to tune these antennas? The commercial and homebrew directional couplers I've seen are huge by comparison to my circuit board and antenna, and the power is so low (a few mW) that I doubt I could get any readings anyway. Any suggestions are much appreciated.

Source record: 70619

This would work reasonably well at 60 Hz or so, but would be very lossy at HF and above. The problem is due to eddy currents which are induced into the metal by the fields from the wire. Toroids for use at RF are usually made from one of two materials. One is powdered iron, which is just that. The particles are insulated from each other, to break the path for eddy currents. (This is the same reason power transformer cores are laminated, but it's on a much smaller scale for the higher frequency.) The other common material is ferrite, which is a magnetic ceramic material. This material can be made to be a poor electrical conductor, thereby reducing eddy currents, while having a high permeability.

I agree with Doug, don't feel bad about asking. Barring the occasional
internet sociopath, hams are traditionally helpful.

The big difference between a ferrite or iron core toroid and a stack
of washers is that the toroid is composed of minute particles that are
glued together with an insulating adhesive so there no conducting path
in the toroid much longer than the diameter of the particles. A washer
is a continous conductor and will act as a single turn transformer
shorted across your winding. It will make the inductor appear to be
shorted out, so the calculated inductance will be meaningless and the
losses will be very high.

Power transformers use steel cores, but the cores in those things are
composed of multiple thin sheets, called laminations, that are
arranged to be perpendicular to the direction that induced currents
would flow if the core were a single lump. Even so, core losses in
power transformers dominate the efficiency until the currents get up
near the ratings and I^2R losses get to be important.

Good ferrite or powered iron toroids are not expensive. They are pretty specific to power density and frequency range. Look at the Fair-rite web page, http://www.fair-rite.com, for some pretty good technical specs.

Good luck,

73

4737. Re: Plate Transformer Source(s)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-04 00:00:00 UTC
From: Steve Robertson <robertsons@zzzsaic.com>
Message-ID: <372F842A.88D6E17F@zzzsaic.com>
Source record: 70624

Hi Lee,

There are a number of sources. In my opinion, Hammond in Canada makes about the widest range of trannies at the best prices. They don't sell direct, but they have a web site where you can check out all their wares (sorry, don't have the URL). Antique Electronic Supply at http://www.tubesandmore.com stocks most of the line and can order anything else that they don't stock. So can STF electronics (oops, don't remember their URL either), and their prices are a bit lower. Anyway, these are good starting points for you.

The ferrite is an inductance amplifier, in some bizarre cases you might actually

get a steel washer set to work somewhat, but I wouldn't count on it.
You won't get the right inductance without using the RIGHT ferrite.

A tried and true method would be to construct a crystal oven with a heater circuit. One circuit I saw a long time ago was used in a Pace Landmaster synthesized radio. It consisted of a small power transistor and load resistor attached to the oscillator crystal can. A circuit was devised that biased the transistor into conduction. The heat from the transistor and the load resistor warmed the crystal. A thermistor provided feedback to limit the conduction as the temperature rose. A foam cover should be placed over the crystal to contain the heat. It will be necessary to readjust the crystal frequency ponce the heater has stabilized.

Bill,

I would recommend good old Heathkit, which has gotten out of the electronic kit business, but is still very active in electronics education. They offer a number of first rate correspondence courses. Check their website, http://www.heathkit.com

Contrary to what you may think to 99.58% of the population the term
"home brew" means beer. It seems a "reasonable" assumption.

Doing both "Amateur Radio Home brew" & " Home Brew" (read beer) I
don't have a problem, but others certainly will.

Source record: 70481

Greetings... I have an original IC706 that the FM has stopped tx'ing... if I key the mike the power jumps on the meter and then settles to almost nothing... If I listen to my sig (what there is of it) on a scanner, it sounds like @#$#@. I suspect the VCO/PLL is unlocked... without having to blow $$$ (many) and have to wait weeks (many) for a service manual, can someone tell me how to check and realign the voltage? I am a tech so I know how to use the stuff... I just don't know where the test points are etc etc etc... any help would be appreciated

Source record: 70484

I worked at a tracking station site where some power supplies were in continuous use for more than twenty years with no failures. When the equipment was moved after twenty years, a number of electrolytic capacitor failures occured. I suspect the (relatively) long power down and (perhaps) mechanical shock triggered failures in the old capacitors.

When I was a student apprentice with English Electric-Leo Computers about 35 years ago, one of my jobs was testing ROM assemblies made from toroidal ferrite-cored pulse transformers. Each transformer had a plastic washer on top of it, and I was very puzzled by one unit that didn't work, but was wired correctly. I eventually found that it had been assembled with two plastic washers instead of the washer and ferrite toroid!

For Sale:

(Add shipping costs to all prices unless stated)
= = = = =

Hallicrafters T.O. Keyer - Mint Condition
Includes original manual. Perfectfor keying any
tube transmitter. Will sell for $85.00

= = = = =

Meters:

Weston Model 506 New in box. Round, black
For Tropical Climate / Navy use.
With scales:
0-200 mA P.A. Plate
P.A. Grid and Battery
Will sell for $4.00

Weston New in Box. Round, black
For Tropical Climate / Navy use.
0-1.5 mA DC
Will sell for $3.00

RCA / US Navy Classic 0-2.5 KV DC
Square front meter with rare 0.005 mF Faradon
bypass cap. 0-1 mA movement, with shunt information
for 2.5 kV operation. WIll sell for $4.00

Or take all three above meters for $9.00

= = = = =

Pair of transformers for a 15-20 watt modulator
Driver and modulator transformer from SCR-522 transmitter
for use with Push-pull 6V6 tubes! Ideal for small
homebrew AM transmitter or as replacements.
Will sell the pair for $15.00

= = = = =

Heavy Duty Footswitch, with AC power cord and H.D.
connectors. Rated 20 Amps. Clipper 632D. Very good condition.
Will sell for $15.00

Smaller footswitch with cord. Flat style, very comfortable to use
for keying up amateur transmitter. Excellent conmdition.
Will sell for $10.00

= = = = =

LOT # 8 of TUBES:
(Some new - others used, tested)

6V6GTA - National, New in box QTY 2 $8.00 each
6V6GTA - Mesa, New, no box $6.00
6V6GTA - No name, looks like new! $5.00
6V6GT - RCA, QTY 5 $4.00 each
6V6GT - Philco, used $3.00

Or take all of the above tubes for $40.00

= = = = =

LOT # 7 of TUBES:
(Used, tested)

6X4 RCA $1.00
12BY7 G.E. $4.00
12BY7 RCA QTY 2 $5.00 each
12BY7 Sylvania $4.00
12BY7A Bulk $4.00
12BY7 Bulk QTY 2 $3.00
25Z6 Silvertone $2.00
35EH5 IEC Japan QTY 3 $2.00 each
35W4 Bulk $1.00
50C5 QTY 4 $3.00 each
6197 Sylvania $2.00
6197 Bulk $2.00

Or take all of the above tubes for $40.00

= = = = =

Neat little chassis - with tubes & transformers!
Looks professionally constructed - size 6" X 4" X 2"
It's clearly, well, a what's-it! Includes 12AT7, 12AX7, 6AL5, with
shields. Allen -Bradley potentiometer, UTC HQA13 potted Inductor,
a 1 uF / 600V DC Sangamo capacitor etc. Two really nice input
transformers, UTC type 89562A Will sell for $5.00

= = = = =

Headphones with boom microphone.
Jensen Model JMP-41
Headset Response is 20 Hz - 20 kHz
6' Cord with mini stereo plug.
Microphone is Low-Z Condenser type with 2.2 k-ohm impedance.
Response 30 Hz - 16 kHz

Durable and comfortable design with padded ear-pieces, ideal for
communications applications.

Brand new in box. White color.
Great for mobile HF or VHF operating. Think SAFETY!
Also great for extended rag-chews, contesting etc.
No PTT, but has standard connectors - 1/8" mini-style.
Will also work well with computers. Normally $29.95
New in box $20.00 plus shipping

E-mail for details or to make arrangements.

>Will White, KD7BFX

Volt-amps = max volts x max-amps without regard to the phase shift which
occurs for inductive or capacitive circuits.

Watts = volts x in-phase amps, resistive circuits only.
```

Source record: 70492

Kelly,

The structure of a torroid is very different than washers. Torroids have a different "magnetic" effect than washers. They are usually made of Powdered Ferrite. Dont use washers because the laquer will chip off and washers conduct electricity, thereby causing a short. Ferrite on the otherhand wont do that , and ytou will have the desired effect of either a choke or just an inductor..

There is a very sound reason for using VA for rating a transformer.

If you are using an entirely resistive load the current and voltage supplied by the transformer are in phase, so you can use ohms law: watts = volts times amps.

Now what happens in an AC power grid when you have lotsa motors and transformers? The load that the transformer is supplying is far from resistive and is usually highly inductive. Therefore the current and voltage are not in phase. Transformers are then rated at the rms voltage times the rms current.

To determine the actual power you need to know the phase angle between the current and voltage. Power companies sometimes put capacitors across the lines to keep the phase angle under control.

It has been almost 25 years since I had a Power Distribution class, so perhaps there are some power engineers on here that can explain it better.

Others have recommended Ham Radio Outlet stores, the
alt.ham-radio.marketplace, and hamfests. These are all good
suggestions and I would like to add mine.

You can get a listing of amateur radio clubs, in your area,
from the ARRL web site, "http://www.arrl.org". The clubs very
often have news letters, and the like, that list equipment
for sale. They may even have a loaner.

Also check with your school. It's very likely that there is
already a club there. If there is they might have a club station
where you can get access to equipment you may not be able to
afford.

Don't forget the great bulletin boards around campus. There is
a lot of people comming and going, all the time, and many are
trying to lighten their load.

4765. Article on Converting UPS for Ham Use?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-05 00:00:00 UTC
From: windbrkr@erols.com
Message-ID: <MPG.119a5adbbf945727989712@news.erols.com>
Source record: 70503

I recall seeing an article on rescuing a defunct PC uninterruptible power supply (UPS) so that it could be put to use in the shack as an inverter, battery changer and DC power supply. I *thought* the article was in QST sometime last year, but my memory is apparently playing tricks on me (again). I can't locate the article in back issues of *any* ham/electronics magazine, not to mention QST.

Does anyone remember where/when such an article appeared? I don't think I just imagined it, although I am beginning to wonder a bit...

Thanks,
Bob K9CMR

There is a usefull side too - V.A. is a better indicator of current requirements of house wiring, fuses, extension cords, etc. than Watts if the equipment has a reactive component instead of just a resistive component. Watts tells you how much work it can do (heat + light + sound + radio waves), V.A. tells you how much current it will draw.

Will,

Please dont be put -off by the dangers of building and using an AA5 radio!!

Just be aware of them and keep your wits about you and I guarantee you'll have a project which, when done, will give you hours of listening pleasure and a feeling of accomplishment!

Even though you CAN use a transformer, why? If you can use the mains only for power,
all you really need to do is mount the chassis in
an acrylic box, etc.. and keep it away from any
small kids (like guns, huh?) if you want to really be safe.

I dont have kids and I'm the only one that messes with radios at home. I built an AM AA5
using the standard 9pin bottles and added an S-meter to boot. It is built on an aluminum chassis with an acrylic front panel so I do have to be careful about the way it's plugged in and also that I am the only one who uses it!

Rather than just copy an AA5 circuit, I decided to hit the books, and figured out the biasing needed so it is really home-brew! I wound my own bank-wound RF coil and oscillator coil on
acrylic rods using #36 magnet wire. Then, I
figured out a way to wind bank-wound IF coils on these same plastic rods so that I could adjust the distance between the primary and secondary for proper coupling. The only other transformer is the audio output. I had
calculated the proper inductance needed but
I added about 10% more wire for the coils to
compensate for any 'kentucky windage' which
turned out well because I did have to do a little adjusting for band coverage at the osc coil.

I did not shield the IF coils, I did not have cans big enough at the time and so constructed and tested it without shielding... As it turns out, with proper construction and attention to possible sources of feedback etc... you can contruct an IF strip at medium wave without the shielding.

I am using an RF amp, two IF amps, detector and audio output and mixer stage and NO
power xformer.

I had a LOT of fun and learned a heck of a
lot!

The little radio plays just great, like a commercial AM radio from 550 to 1700 Kc!

So, please don't be discouraged, just have fun
and be SAFE!!

Your radio pal, Tony

That's ok we can argue all we want about keeping the code test, but something needs to be done to bring people into amateur radio not keep them out. Soon enough all the brass pounders will be gone and then the FCC can sell of the rest of the ham spectrum. How soon we have forgotten about 220 MHz.

>
> Steve

Steve -

I sent you a rather polite note suggesting that you should not spam the
rec.radio.* groups. Of the groups this was sent to only
alt.ham-radio.marketplace and rec.radio.swap are appropriate for sale
postings. While the others are becoming overrun with spammers like you that
does not make it right. REc.radio.amateur.equipment in particular has become
nearly useless for its intended purpose, the *discussion* of radio
equipment. Crossposting sale stuff to multiple inappropriate newsgroups is

spamming. Please see the charters for the groups, or see the "Guide to the rec.radio usenet groups" or some similar posted monthly by Jeffrey Herman on about the 15'th of the month. If you can't wait do a lookup at dejanews.

In the meantime, please use the groups for thier intended uses. In particular rec.radio.amateur.homebrew is a discussion group, as are most of the others you are posting to.

Maybe so, but the charters for these groups was set by a democratic process that involves a call for discussion, a discussion period, and then a vote, where there must be 100 more votes in favor than against, as well as a certain number of votes total to create a charter for the group. If you wish to change the charter feel free to go through the formal process to get things changed. Subscribe to news.groups if you would like to understand how the usenet groups are created.

The forsale folks filling up the rec.radio.* groups seem to fall into three general groups:

(50%) those who didn't know that rec.radio.swap is the place for sale items, who are happy to post to the right group when they are informed.

(25%) those who do know, but feel that whatever they are selling is such a good deal, or so interesting that it should be shouted in all the groups and

(25%) jerks who don't care about anything but peddling their stuff.

I'll leave it as an exercise for the reader to place "pink" in the proper bucket.

As for just skipping over the sale ads, this doesn't work. When the sale ads are 3x the discussions that the groups are designed for the discussors stop reading and discussing, because there is too much clutter to wade through. Rec.radio.equipment is an example; it is hard to find any discussion left there, but there are plenty of duplicates of rec.radio.swap postings.

Let's work together to keep the newsgroups litter free.

In article <372ECA73.7FDF937A@asu.uswest.net>, Will White <wcw@asu.uswest.net> writes:

> keep coming across the abbreviated voltage rating "V.C.T." with respect to
>the secondary/output of power transformers. Can someone please spell this
>abbreviation out for me and explain what it refers to?
>
>Also, why are power ratings described in terms of volt-amps (V.A.) instead of
>watts in some components?

Hello Will,

As others have explained, "VCT" means "volts center tapped" and refers to the entire secondary voltage. It's a shorthand way of telling you the voltage of a secondary, plus the fact that it is center tapped.

VA means Volt Amperes. As others have explained, this term has to do with reactive loads. It is the product of the voltage and curent delivered, regardless of the phase angle involved.

If you are still puzzled by explanations involving phase angles, here's another way to look at it:

Suppose I have a transformer with a 10 volt secondary. If I connect a 10 ohm resistor across the secondary and turn on the power, the resistor will draw 1 ampere and dissipate 10 watts. The transformer must deliver 10 volts at 1 amp to the secondary, which means 10 watts.

Now suppose I replace the 10 ohm resistor with an (ideal) capacitor having 10 ohms reactance. (At 60 Hz that works out to 265 uF). The capacitor will draw 1 ampere - but that 1 ampere current will not be in phase with the voltage, and no power will be dissipated in the capacitor. (It's ideal). But the transformer still has to deliver 1 ampere at 10 volts. The fact that the current and voltage are not in phase means nothing to the transformer - it still has to deliver 10 volts and 1 ampere. 10 volt-amperes, in other words.

The same is true if a 10 ohm reactance ideal inductor is used, or various combinations of resistors and capacitors or inductors.

So the only realistic way to rate transformers is by their VA, because if you rate them by watts, it could be assumed that they will be unaffected by reactive loads - which is not the case.

A whole lot of stuff snipped:

Bob and anyone else who reads this.... While I may agree with you for the most part, I must question something here.

USUALLY (95% or better) when I advertize something, I try to stick to Rec. Radio Swap. I'll admit, I may have screwed up a couple times and posted elsewhere, especially early on when I first started to advertize and feel my way around. BUT my point is, is that I seem to recall a time or two, when I posted on ONE news group and it automatically appeared on a couple others. I know this because, I'm too lazy to type it in twice. And too dumb to know how to reproduce it to more than one news group at a time. A computer whiz I'm NOT! I know enough to get by.

So, IF that is true (automatic crossposting), then I was not able to control that. Except not to have posted in the first place. IF that DOES happen, then how can one prevent a post from being cross posted to an unintended target?

I don't agree with a lot of what appears on on the news groups, out of context either, but I've seen MANY arguments about it, when folks tried to curb it. So, I just shoot by the ones I don't care to read, and move on to those I do. It's like trying to put out a forest fire with your urine. If no one is going to listen, why bother? It's like anything else, SELF CONTROL! There's very little of that anymore. Be it the ham bands, cb, computer, highways, etc.

Whatever the case, I STILL enjoy the newsgroups very much, and the chance to talk with you folks whether we whole heartedly agree or disagree.

Thanks in advance for any clarification you can give to my question regarding cross posting.

Jack,

Brass pounders will always be around, and in large numbers too. As for new blood in Amateur Radio, there is plenty of that too. Where did the notion that Amateur Radio is dying come from? At my extra class exam (recent) there were about 5 youngsters aged about 10 taking the 5 WPM code test. Come to think of it, there were kids testing at every one of the test sessions I attended.

I think we need to worry more about the F layer falling.

73,

Marv

Chicken Little is an old tale. No one learns. Seems folks are always the same.
Thank you for an independent observation.
I suspect the same small fraction of 13 year olds are still learning code. Like many things that require a little work up front, CW is worth it.

You may actually want a device designed to remove
specific noises such as the MFJ noise canceller.

Otherwise if your primary mode is SSB and you wish
to fight noise I understand the NIR-12 to be preferred.
(I had a Timewave 599zx and it doesn't handle noise
terribly well. I have sold it and acquired a NIR-12
but have yet to test it.)

4785. Plans for a 1.2 GHz CW transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-06 00:00:00 UTC
From: cmcdonld@thezone.net
Message-ID: <7gsaki$n2f$1@nova.thezone.net>
Source record: 70522

Any one have plans for a simple 1.2 GHz CW transmitter and reciver. I need it for a project I'm working on. I'm planing on building two or three 1.2GHz becons for a robot navagation system simlar to GPS. The becons will transmit my call sign every few secons and on board the robot there will be a high gain beam (6-10 directors) on a rotor that will tell the computer how many degrees off center each transmitter is and the the computer will calclate the location of the robot. I want to go with 1.2 Ghz or above because the wave lenght is so small I would be able to easyly build and mount the antenna on the robots "head".

So dose any one have a set of plans to build a simple 1.2 GHz transmitter and reciver or any Ideas for a simpler way of doing this.

Pagers are used for receiving (well, most of them...there are some two way pages available) so they are not too concerned with matching the antenna.

It is very easy nowadays to make a receiver that is far more sensitive than what is needed, which allows the use of a lousy antenna. It also helps when you have a tall tower and can radiate several kW ERP.

What you are doing is quite a bit different. You want to have a compact portable transmitter. This means the package must be small and not weigh very much, which in turn means small batteries and a small antenna. You will not be able to put out much power, as you already mentioned.

Since you need only a few meters of distance I don't think you really need much of an antenna at all. You could try one of the compact rubber ducks designed for UHF or, as far as that goes, a full size rubber duck. After all, they are only about 3 or 4 inches long. You may also find that, over short distances, you don't need any antenna at all.

If I was you I would then adjust the transmitter for maximum receive signal.

>shock triggered failures in the old capacitors.

In our broadcast plant, equipment operates 24x7, sometimes for decades.
When the power company needed to change our underground service due
to some renovations we were making, we scheduled a power down so that
they could do it. When we brought the equipment back up (after carefully
confirming that line voltage was the same), literally dozens of pieces of
equipment had electrolytic capacitor failures. Some were in power supplies,
others were coupling or bypass capacitors. Our staff spent a busy couple
of days getting everything repaired.

It is a common experience that most electrolytic capacitor failures
occur at power on. This incident reconfirmed that. If the equipment
stays under power, the capacitors can last for decades, but turning
it on and off stresses the components. (Same thing with tubes, we
had to retube a number of monitors and scopes in this same incident,
emission didn't come back after the power down, or in some cases
filaments opened up when power was reapplied.)

It would seem like a simple link, wouldn't it? We started out with little transmitters (AM, on-off keyed) and receivers and 1/4-wave whips, which worked OK, but were inconvenient. The first thing we tried was just folding the antenna up and putting it inside the boxes (about pager sized). Signals on transmit were down about 20 dB right away (measured on the spectrum analyzer with a "reference" antenna), and presumably the same loss was had on the receive end. Radiation "pattern" went all to hell too, and the link success rate fell to as low as 20%. Little "rubber duckies" about inches long improved things, but there's a serious incentive to putting all the antennas inside the boxes (nothing to snag on), where of course there's hardly any room for air, never mind antennas. Ground plane on the PC boards is hardly worthy of the name.

So the requirements tend to militate toward the least-lossy small antennas we can fit in boxes about 2 inches on a side. Tuned loops of some sort, presumably as used in pagers, sound likely. A more sensitive receiver (FM this time!) is in the works, but in the meantime, I'm trying to make this system at least a bit more reliable.

Thanks for the help!

Marv OM,

I agree with you. I don't see ham radio 'dying' at all. I operate in excess of 12 hours a week on the air, basically all CW. Over half of that is mobile CW. The CW bands have plenty of ragchewing going on all the time. I know, I am one of them. And I spend almost all my time on only one band: 40M. A while ago I worked a 16 year old in Phoenix who was running homebrew TUBE-TYPE gear he had made himself, from old handbook articles. Said he just wanted to play around with tubes is all. Have worked several newer hams, some in their teens, who started with codeless techs, then discovered (some to their total amazement) that CW is an excellent ragchewing mode, and works very well. Some are excellent CW ops, know procedure, know how to listen, with less than 2 years experience in ham radio. They try to spread their enthusiasm to some of their non-CW friends, often with no luck. So they go their own ways.
The message here? You are either interested or you are not. Nothing new going on here. CW will continue to be used by the many who find it enjoyable, that is, can attain reasonable skill at it. Apparently many non-cw ops think we are all WORKING to use it, writing stuff down, using straight keys, egad! Hey, it is just another language guys, if you are proficient, and is effortless to use. If you're not wired for it, there are many other modes to use. That is one of the beauties of ham radio.

73,
Don, W6JL

Well, simple question - what are they?. There will be a name/type plate
or two on them. Also what do the controls look like?.

Quite often you can convert them but the yes/no and method depends
entirely on the answer to these questions.

That is the point. There are many modes that don't use CW. Many that are interesting and satisfying that don't need knowledge of CW to use. The hobby is diverse and growing more so all the time. Yet there is truly only one test for suitability to belong to the club: knowledge of code.

I have the skill to pass the practical test (and have with the training software) through Advanced, yet I hold only a Tech ticket because of the code. I am still trying but I haven't found my method for learning code yet. I memorized the tapes, and have tried a couple of different computer tutor programs, but so far I have not been able to master CW. I will get it eventually, but it is not coming easy. I resent comments from other hams about being an "appliance user" or the comments on this list about code being a "moron filter." We all have assets in different areas. Learning the code is just plain a bitch for me, and is for others.

I see Techs filling key spots in many clubs, taking on important jobs in weather nets, coordinating public service activities and the like. Some of these folks will upgrade, and some will not. The code will be an obstacle for some, the practical test will be an obstacle for some, and some are content with what they can do with their current ticket. None deserve to be looked down upon because of lack of code speed.

Nice USENET police work Bob. My hat is off to you and the job you do.
Uh....your complaints are actually off topic Bob. Write yourself a Internet
Infraction Ticket. You need to leave a valid E-mail address so you can
receive your electronic summons for your appearance at the Judicial Chat
Room to receive your trail date.

Why not start a crusade against wasted bandwidth discussing what radio group
a radio item for sale should be posted in. You have caused more clutter
with your complaints than a single amateur item posted for sale in the wrong
radio group ever did.

rec.radio.swap is such a dirt whole of dealers, auctions and spam it is easy
to understand the temptation of an individual party to post in some of the
other NGs.

IMHO.....

4802. Looking to sell Tek scope collection...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-06 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <37325062.4CBB@pop.removethistomailme.net>
Source record: 70539

Just upgraded to a new DPO for the shack and need to sell some existing gear to make room. The following are available for inspection and pickup in Kirkland, Washington (Seattle area):

Item 1

Tektronix 434 analog storage oscilloscope, 25 MHz bandwidth. In excellent condition, fully operational, with original manual. Front panel and CRT like new.

$100.00 firm if picked up locally, or $150.00 plus shipping otherwise. The other scopes listed below must be picked up locally -- I don't want to ship them due to their size and fragility.

Item 2

Tektronix 7834 oscilloscope (400 MHz mainframe, variable-persistence analog storage) and 7603 analog (100 MHz mainframe, non-storage) oscilloscope, with the following plugins:

1 7A26 vertical amp (8-9 out of 10, works great)
1 7A12 vertical amp (cosmetically 6-7 out of 10, works great)
1 7A12 vertical amp (cosmetically 6-7 out of 10, works great but Ch1/Ch2/Alt/Chop/Add switch is a little balky, probably needs lubing)
1 7D15 225 MHz counter (near mint, w/manual on microfiche)
1 7B53 trigger (excellent)
1 7B92 trigger (near mint cosmetically, but every few minutes it'll skip a trace or two for some reason)
1 7A13 differential amp (excellent, w/manual on microfiche)
1 7D02 logic analyzer (no cables/probes, seems to boot OK in the 7603 but otherwise untested)
1 7D01 logic analyzer (no cables/probes, seems to boot OK in the 7603)

Both 7000-series mainframes and all plugins listed above for $350.00 firm. Includes original Tektronix manuals for 7834 and 7603 mainframes. Again, this gear must be picked up in Kirkland.

Item 3

Tektronix 454 oscilloscope (150 MHz portable), excellent cosmetic and operating condition. $75.00 firm, including original Tektronix manual (missing cover and some pages near front).

Or pick up all 4 scopes for $450.00. Start your collection today! :-)

Personal check OK. Email with any questions or to arrange an inspection
(note the spamproofed address). .JPG photos available on request.

It wouldn't be a problem if there were only "a single amateur item posted in
the wrong radio group". Rec.radio.amateur.equipment has become completely
(> 70%?) overrun, and I see the spam spreading to the rest of the groups.
What would be so hard about using the groups for thier intended purpose?

How sensitive is "ultra-sensitive"?
How wide band is "wide band"?
What frequency range?

If there's a radio station, TV transmitter, Pager, Cellphone,
Ham band, Commercial band, Garage door opener, Cordless phone,
baby monitor, FRS radio, radar detector, airplane, remote controlled
toy, unshielded computer, (the list is endless) inside your definition
of wide band, an ultra-sensitive field strength meter will be all but
useless.

You could build a swept narrow-band field-strength meter,
normally called a spectrum analyzer, but they're typically not
ultra-sensitive.

Some software (e.g., Morse Tutor Gold) is pretty effective, in that it sends typical, but random, QSOs. Of course that may be boring (many qsos are!), but it is better than the old 5 element groups.

>antennas in them are quite small. I have need for very small antennas
>for a short-range (a few meters) wearable data link at 70cm, and haven't
>found much data on them so far.

At our local club we had an practical evening where we had to make a
small helical aerial for our handhelds for use with our 70cm repeater.

The aerial consisted of 8 very close wound turns of 16 swg wire over a
piece of plastic biro case. One end of the coil replaced the centre pin
of a BNC plug. The piece of biro was a tight fit in the end of the plug,
replacing the normal locking nut.
>
>Also, what sort of measuring equipment can I buy or build to tune these
>antennas? The commercial and homebrew directional couplers I've seen
>are huge by comparison to my circuit board and antenna, and the power is
>so low (a few mW) that I doubt I could get any readings anyway. Any
>suggestions are much appreciated.

We used two methods. A field strength meter and an AEA UHF anaylst.
Short pieces were nibbled from the open end of the coil until it
resonated about 1MHz lower than needed in the band. Then shrink wrap was
used to 'seal' the coil in place. The shrink wrap brought the resonance
up to the appropriate place in the band.

On the practical side of things this small (about 1 inch sticking up out
of the BNC plug x about 0.5 in dia overall) works very well. 700mW gets
a fully quietening signal into the repeater 4 miles away. Also when the
rig is stood in my kitchen my movements around the room have far less
masking effect on the received sigs than with either of the much longer
commercially made rubber duck type aerials I use.

Hope this may give an idea of a direction to try.

Seems to me the quantity you are selling indicates that these
chips may have been provided as Samples. Selling them
would be a unwelcome act in the eyes of Plessey Semi. I
dout anybody would buy them, as most people involved
with IC work have access to there own supply. I really
hope that this is not the case.

I can't help you with your xmitter, but I've heard of similar problems solved for autonomous model helicopters. I don't have a web reference for you, but you might start searching at Stanford and Georgia Tech. Some of the solutions used primitive inertial guidance; one used differential GPS. It seems to me ultrasonic audio would work just as well; I haven't a clue on the range and resolution you need, though. Granted, there's something anachronistic about Tobor's rotating parabolic dish.

Good luck.

Michael.

Source record: 70554

Chris,

There are a number of all mode scanners available which will receive 1.2 G. The AOR8000 has been posted on the swap group lately.

Now transmitting COULD be an easier proposition, since you are looking for a CW beacon. Consider using a lower IF strip, and a varactor for varactor multiplying. An FM unit can be converted to a transmit converter by modifying the final amplifier to act as a mixer.

A varactor multiplier is a very efficient device, relatively. Efficiencies in the 50 - 60% range can be achieved. It also does not need a DC supply, so one can be mounted right at the antenna. One limitation is they produce sever distortion on SSB, so are only usable on CW, which fits your application.

One scheme would be to use a varactor tripler in conjunction with the transmitter strip from a commercial 420 MHz FM transceiver.

A company called Microwave Modules has produced these units in the past.

I hope this helps a little, and will maybe generate some more brainstorming for you.

73, Mike

I just finished giving my seven year old his code lesson. He's learning the code to earn a award in his Tiger Cub Scout group. He is a seven year old that came to me to learn the code, and has no interest in radio, I would think that anyone who is interested in radio should stop crying about it and donate the 15 minutes a night for 2 weeks, and learn it.

No one complains about having to learn how to use windows before they can surf the net....

It's like the antenna bible, the author is KRAUSS(spelling?), and I
can't remember the title. I worked on a 930 mhz pager project once and
that book was referred to.

I just hope you are very up on advanced math. It's not like reading an
ARRL manual.

As far as test equipment goes, we used the very state-of-the-art HP
analyzers and it did the job. But the prices were $$$$$K. However, hams
can achieve good success on much less.

Fabio,

Look into winSMITH 2.0 by Noble Publishing. I think they have a web site but
I don't know the ADR. Or you can give them a call at US 770 908-2320.

I've been using this package for about 6 monthes now and it works great. It
allows you to add all the common circuit elements to achive a match.

"Marconi vs Sarnoff"
You said it perfectly in those few words, Adam.

Fluid pricing via networked auction is the wave of the future
in many, many areas- not just in radio stuff.
Hams are into it early because (contrary to cynical popular myth)
most hams are progressive people.

The charge of "clogging up the newsgroups" is nonsense.
Those who wish to participate in the new market can do so.
Those who do not can set the filters on their browsers
and they will never even see the deals go by,
leaving them with the "pure" version they claim to desire.

Bandwidth charges are equally nonsense. The binary groups
distributing graphic files and programs take up
thousands of times the bandwidth of the ham groups
with lots to spare, thank you. If we tripled the
number of radio ads here, we'd still not be a speck
on the bandwidth map.

It is useless and senseless to protest against this new market,
especially when every modern browser is capable of
deleting messages some people claim they don't want to
see before they ever see them.
You don't read every word in a newspaper, either.
I don't see anyone calling their newspaper and
complaining "you print some things I don't want to read!"
That would be silly. It's equally silly to protest
against newsgroup articles they don't want to read
when they have the means to simply *not see them*
right at their fingertips.

People need to stop claiming they are somehow being harmed
by the sale posts. It just isn't true.
They're harming themselves by not setting filters
that were put there for that purpose.
Same as someone who refuses to wear a seat belt-
he has no one to blame for his bruised forehead but himself.

Steam engine makers and tube manufacturers protested, too.
And the future --just-- --kept-- --coming.
You can stay behind if you wish.
But don't damn those who choose to progress,
especially since they are not harming you in any way.

For a transmitter, why not use one of the local oscillator circuits for the 1.6 GHz ISTM (?) television receivers of a decade or so ago? I used to have one (it may still be in the junk box), and as I recall, it was just a tuned line oscillator on a PC board, using an MRF901. Not all that stable, of course, but it may suffice for short-term OOK use. An LO chain for a WEFAX satellite receiver might be another good place to look.

I am by no means opposed to auctions (at least for tangible equipment --
spectrum auctions are another story!) But as for advertising them in
places other than groups whose charters allow advertising...

David Stinson wrote:
> The charge of "clogging up the newsgroups" is nonsense.

Filters are a smoke-screen, which I refuse to use, either in my
newsreader or my mailer.

The problem is, that your computer must still download the header of the
message in question before your filters can act on it. Not really a big
deal for *most* American users, who don't pay per-minute connect charges
and who have fast modems. Quite possibly a serious problem for users in
some foreign countries, who can't get unlimited-time Internet accounts.
(and also possibly a serious problem for Americans in more rural areas
who have to pay long-distance telephone charges to reach the Internet)

Why should DX3DX have to spend his money to download and immediately
reject headers of messages that, by group consesus, should never have
existed in that forum? This is why there is a separate group for sale
items: if DX3DX is shopping for equipment and *wants* to read sale ads,
he knows where to look -- if he's shopping for technical advice, he
knows to look in a different place.

(I must wonder if this is why the proportion of DX amateurs
participating in the rec.radio.* newsgroups is MUCH lower than the
proportion of DX amateurs in the hobby in general)

Unfortunately, you're probably right that the sale posts will never be
eradicated from non-sale groups, just as spam will never disappear from
our email boxes. Sure doesn't make it right.

> Keith Lodahl
> Mayville, Wisconsin

Hi Keith OM,

Thanks for the thoughtful response.
In WWII, the military taught Morse code to literally thousands of people from all kinds
of backgrounds and abilities. Many of them were not doing it voluntarily, either!
I myself cannot see where using "tapes" and "computers" is an effective learning method
for learning to use the code conversationally, as we do in ham radio. First of all, it
is boring, listening to basically boring content being sent. As you said, you eventually
memorized the tapes. That should be a clue that that is not the way to learn the
code. Why not listen to something interesting instead?
To become comfortable with CW, you have to 'USE IT' for some purpose. Listening to real-live
conversations on the air is what made CW take off quickly for me. Fortunately, in those days
there was no distracting temptation to somehow 'use a computer' (a distinct advantage, from
what I can see). Second of all, it does nothing to teach you how to listen to REAL
WORLD signals off the air, while at the same time, you are internalizing what is being said.
This is what worked for me. It has been music to my ears ever since, and is definitely my
preferred mode for ragchewing on the air, compared to using voice. When you are otherwise
just wasting time (ex: while driving), sound out everything you see

written: street signs,
license plates, etc etc. Make the sounds of CW very familiar to
yourself, so that
you associate those sounds immediately with the letters and numbers and
punctuation.
This all requires zero investment in $$, and can be done anywhere,
anytime. Lastly,
listen ON THE AIR to real CW QSO's, as much as you can, to all kinds of
fists, in various
conditions of in the clear to buried in the QRN/QRM. Watch out! You
might suddenly
become hooked; that is a risk you take. If that happens, you will
suddenly see yourself
on the other side of the perennial code argument, and can't for the life
of you figure
out what all the fuss is about; it has happened to many others, HI.
Lastly, like anything else, CW is not fun for EVERYONE. Some people
just do not take to it.
But that is a very small group indeed, I think. Especially at the
moderate speeds required.
After all, 5 WPM you can practically look up real time. 13 WPM actually
requires that you
know and can respond almost immediately to the characters. This does
not seem to much
to ask, for a large number of us. I believe it is an essential part of
one's education
to become a ham and to use HF (the 'real' ham radio to me).
You can do it.

73 and GL,
Don, W6JL

4832. Homebrew Noise Cancelling Headphones?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-07 00:00:00 UTC
From: Jim <jbolinger@Nloisnptaemk.com>
Message-ID: <3733399b.0@news.netwalk.com>
Source record: 70568

Some of you may not be aware that a loudspeaker (permanent magnet type) can also be used as a microphone---a sound wave will vibrate the speaker cone and induce a current in the coil. They are not 'great' microphones but work reasonably well.

Depending on the type of element used I would expect headphone elements to have the same property. What I am considering is using this phenomena to build a small box for converting regular headphones to electronic noise canceling, to be used on board small aircraft. It could also be used in other applications.

The expensive ones use a separate microphone inside the ear cups for sensing the sound inside the cup. This is then applied to a circuit which makes sure that the sound in the cup is as close as possible to the output of the radio, effectively canceling ambient noise.

My idea is this: The current in the cord going to the headset consists of two components, the desired audio from the radio and a current produced by the ambient noise. If this current was subtracted from the signal from the radio, inverted, added to the signal from the radio, and then applied to the headset it should cancel the ambient noise.

Has anyone tried this, and how well does it work? It certainly would be less expensive than the $400+ ENR headsets.

Any other thoughts on this?

> Mayville, Wisconsin

Keith,

I forgot one other important point in my post. DON'T WRITE STUFF DOWN. Copy it in your head; that is how you will be using it for ham radio ragchewing. Writing it down is an (unnecessary and limiting) habit that you don't want to get into if you can avoid it. I sometimes run into ops on the air who ask me (as I am working mobile CW) "how do you write it down?". Egad.

73,
Don, W6JL

You're wrong, and it's been explained before.

> It is useless and senseless to protest against this new market,

There is no market here. Go away.

> especially when every modern browser is capable of
> deleting messages some people claim they don't want to
> see before they ever see them.

It is not our job to delete them. It is the job of newsgroup participants
not to post them where charter forbids them.

> You don't read every word in a newspaper, either.
> I don't see anyone calling their newspaper and
> complaining "you print some things I don't want to read!"

As a matter of fact, newspaper switchboards are overloaded with such calls.

> That would be silly. It's equally silly to protest
> against newsgroup articles they don't want to read
> when they have the means to simply *not see them*
> right at their fingertips.

If you can't play nice with others, go somewhere else.

> People need to stop claiming they are somehow being harmed
> by the sale posts. It just isn't true.

Flat statement without substantiation. Typical spammer tactic.

> They're harming themselves by not setting filters
> that were put there for that purpose.

But we do. They usually take the form "Provider, please stifle your spammer."

> Same as someone who refuses to wear a seat belt-
> he has no one to blame for his bruised forehead but himself.

A completely inappropriate analogy.

> Steam engine makers and tube manufacturers protested, too.
> And the future --just-- --kept-- --coming.
> You can stay behind if you wish.
> But don't damn those who choose to progress,
> especially since they are not harming you in any way.

You'll pardon us if we keep fighting to keep things the way they're meant
to be, and work to get spammers off the 'net. Or you won't pardon us, but
we'll keep doing it anyway.

My reply to the original post was really not worded properly.
here goes again, and my opologies to anyone that was offended.

Seems to me the quantity you are selling indicates that these
chips may have been provided as Samples. Were they originally
provided as Samples. If so ,then selling them would be a unwelcome
act in the eyes of companies that supply samples. I dout anybody would
buy them, as most people involved with IC work have access to there
own supply. If these chips were not supplied as samples, I do not
think any of the opinions I have expressed, would apply to you.

4845. (help) Injecting audio into mic plug--strange result--input impedance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-08 00:00:00 UTC
From: nx7u@primenet.com
Message-ID: <37337fc1.4404132@news.primenet.com>
Source record: 70432
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I wanted to run my IC-551 thru some audio paces, so I dug out a trusty HP-651 audio sig gen which is calibrated in mV and has a 600 ohm output.
Supposedly the IC-551 wants a 600 ohm (or thereabouts) microphone, so that should work, right?
Rigged up a cable, BNC (from the HP-651) to 4-pin mic plug.
Fired it up, and tapped off the sig gen with a BNC "tee" to an audio voltmeter to monitor the actual applied voltage.
With the sig gen initially set to 1 volt (!), all I got out to the mic plug was 1.4mV (that's milli).
I verified the sig gen was OK by placing a 610 ohm resistor across its 600 ohm output; sig gen and outboard audio meters matched up.
This would tell me that the input impedance of the mic jack is <0.5 ohms!!!
Did I do the measurement wrong, or is my audio stage whacked, or is this actually the nominal result?
PS When I hook up a mic and monitor with another receiver, the audio sounds fine. I would think if the audio input impedance was really 0.5 ohms, there would be little mic output to speak of (pun not intended...)
Any observations? Thanks in advance!

>avoid it. I sometimes run into ops on the air who ask me
>(as I am working mobile CW) "how do you write it down?". Egad.

Hi Don!

Hmmm... I've heard this admonishment before, and I really don't understand it. I've been operating almost exclusively CW for over 30 years, and I've always written it down. It feels natural to me. It goes in my ears, it comes out my hand. It's not particularly legible above 30 wpm, mind you, but I can refer back to my notes in a ragchew and remind myself of what was said. (I can't recall a 10 minute monologue, but I can if it's written in front of me). Later on (2 or 3 qsos late), I can jot down a note or two in the log if I want. My wife can look over my shoulder if she wants. When visitors come over, they can see that the process actually works... morse in, words out. Above 35 wpm or so, I'll put the pencil down and copy entirely in my head, but if somebody throws a long unfamiliar and non-phonetic word out there at 45 wpm, I'll probably miss it, and I've found that's usually the case for people that "only copy in their head", even at slower speeds. And speaking of slower speeds, people that copy only in their heads have difficulty with copying 10 wpm qsos... I think you forget what was sent at the beginning of the word at that speed... hi.

Besides the practicalities, I think it's easier and faster to learn code while writing it down. As you decipher a letter aurally, you write it down, see it with your eyes, and it connects you with the part of your brain that already knows how to read and write.

Hey, different strokes for different folks, but I think it's a lot easier and more practical to learn code while writing it down, and make the transition to head-only copy later on if you need or want to. Am I the only one in hamdom that thinks so?

Sounds like it might be difficult to use the loudspeaker for both functions simultaneously. I am not up on control circuits but I think you would end up having the thing fight itself without cancelling the ambient noise.

By the way Sony has a real neat set of noise cancelling ear phones that really work well. I have also seen a retrofit kit for a David Clark set in one of the "Private Pilot" mags.

4854. checking transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-08 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <3733FC45.B50956D4@asu.uswest.net>
Source record: 70441
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I picked up 5 power transformers at a hamfest a month ago. Only one is marked at all (has leads tagged '110,' '290,' and 'Fil'), the others I don't know a thing about (but I got them very cheap). I need to know how to check unknown transformers for voltages, polarity, which side is primary, and of course, whether they are good (not open or shorted) to begin with. How do I determine each of these parameters (and current rating, if possible), safely and accurately?

All I have in the way of test gear is a good RMS DMM, a cheap analog VOM, a 7.5A variac, and a couple of non-variable, non-metered 13.8 VDC power supplies.

In addition to the info above, can someone tell me how, if possible, to check transformers at hamfests with a DMM or other handheld instrument, at least to see that they are good?

Thanks for all replies.

In addition to the other resources mentioned in reply to your post, might I suggest joining an amateur radio club in your area? You will find some knowledgeable folks who are (most of the time) eager to help new hams, making wise and frugal radio purchases and in other radio-related matters. Someone in the club, if it is of any size, is bound to have one or more rigs surplus to his needs that you might get a fair deal on.

"Egad" is an archaic contraction of "Ye Gods!", more or less "oh my god," or some similar emphatic expression. It would be a good one to add to the CW vocabulry, I think ;)

4858. Re: checking transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-08 00:00:00 UTC
From: Gord Skiffington <skiffing@nbnet.nb.ca>
Message-ID: <37345072.6B5C@nbnet.nb.ca>
Source record: 70445
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

Howdy Will....I know there's all kinds of sophistocated ways to check transformers (you know...proper!)....but I to have the sort of gear that you have and this is how I do 'em. First of all, at the fleamarket table, if you wanted to just do a rough test with a VOM/DMM...Keep in mind that the MOST likely combinations of windings are:

1. 2 lead windings - both primary and secondary
2. 3 lead center tapped windings ....secondary (power xfmrs or primary
on say interstage audio etc.
3. Multiple tapped windings....usually with some taps placed close to
one end of the winding in question....primary (power xfmrs) or
secondary on special units such as used for tube testers and other
test gear.

Of course the above is not exhaustive but represents the majority of units....Now...for power xfmrs (your lot)....there may be a single primary winding or possibly 2 (the 2 are used in series for 240 vac operation and only 1 will be used for 120 vac typically). Look for any commonality as to color coding of wires and tracers for example GREEN, GREEN/YELLOW, GREEN which might indicate that this winding has a center tap at the GREEN/YELLOW wire. Use the wire guage as a clue as to commonality..especially if you can see the stub of the actual winding. Simple DC continuity test with your VOM/DMM will prove continuity and your DMM, if good resolution on low ohms, can give you a rough idea of relative size of the winding (for example...low reading and heavy wire its NOT LIKELY to be HV). Next check continuity from any wires to the core...looking for shorts to the core. From there its lug-it-home time and onto your test bench. (Don't forget to use your smell and a good visual of the XFMR at the fleamarket as a guide also!!!).

Home in your shack.....Get that VARIAC out....experience will help as you go along (you'll either know or suspect that its a power transformer for example). Dial down your variac to a low voltage level...say 3 or 6 volts....and begin by seperating and marking all windings as common that you determined with your VOM/DMM......apply voltage to each winding in turn and note the resulting voltage on the other windings....this will give you a clue as to the AC transformation ratio.....from there, with experience and armed with your other clues (wire size and color) you'll begin to get a picture of what you have. If the VA rating is marked on the case you can then get an idea of the current capability of the

unit...roughly for example if say its marked as 60va then assuming a 120vac primary that tells us that the primary (or any winding) can only handle 60va (volts * amps) which would be .5 amps. Now extrapolate that to the secondary windings.....if you see a 10:1 ratio between what you've determined to be a possible primary and a secondary, you'd see that the secondary would be able to handle no more than 5 amps and 1/10th the voltage of the primary....12 vac at 5 amps....You can confirm usuability at 5 amperes by placing a resistance across the secondary and AC ammeter in series to verify that this will meet your needs at the current.

Testing for multiple tapped windings takes a bit of experience but you can get a rough idea from your DC ohmmeter testing (if low ohms resolution is good) AND by applying very low AC voltage to the various combinations of 2 leads in that multi-tap winding.....and measuring the resulting volage across THE REMAINDER OF THE SAME WINDING's leads. These multi-tap primarys are used, of course, to make minor adjustments to compensate for high line (primary) voltage or low line (primary) voltages which might exist in different parts of a country.

All the above is not exhaustive and there are some pitfalls..... Remember the "apply low AC voltage" thing.....if you apply 120vac for example to a 12 vac secondary, there will not be enough TURNS PER VOLT to allow the winding to safely run even unloaded and you'll get a huge bang and either trip your cct breaker or ruin a winding. WATCH OUT FOR HIGH VOLTAGE even when testing with low AC voltage applied.....remember that you are determining turns ratio's and might be applying 6 volts to a 5 volt secondary winding on a XFMR which might have a 240 vac or higher primary.....could be a lot of voltage now appearing across the primary!!!! (I know!).

Check older copies of the Radio Amateur's Handbook and other publications for typical transformer wire color codes which, while not conclusive, may give you a clue as to useage......for example BLACK wires are often (but not always) primary's.....GREEN wires might be low voltage secondary's......Yellow might be low voltage 5 volt secondaries.....RED was often high voltage....(several hundred).... For all these examples there are a hundred contradictions so be CAREFUL, RESPECT OPEN TWISTED CONNECTIONS but HAVE FUN!

73 - Keep on Tinkering......THAT....is REAL HAM RADIO.

May we assume you have checked the integrity of the cable(s) and connector for any shorts or opens?

May we assume you calculated the input impedance of your rig based on your test results, rather than measuring it? Have you measured at least the ohmic value at the mike input?

We've been getting sealed lead-acid batteries from various hospitals in the area and I've accumulated a few with no good way to properly charge and discharge them. Can anyone point me to a controller circuit that will let me use my ASTRON power supply to provide charge and trickle (float) charges to these things? I don't want to build a power supply and charger, I'd just like to use a controller on the power supply's output.

Thanks,
Dan

Scott: I wonder if it's possible your had the frequency of your
signal generator at some frequency much lower than voice frequecies.
Perhaps the input stage is transformer coupled, such that the input
impedance is very low at low frequencies. I've done this before...
had the band switch to Hz instead of KHz, and ended up with 1Hz out
instead of the intended 1 KHz. Just an idea...

I've had good results using gel cells floated across an Astron power supply,
with a diode for isolation. Keep the supply voltage low enough to keep the
battery voltage at 13.8V max so as not to overcharge the battery.

A long time ago, I obtained a Marx model railroad transformer. I set it's output at 11.5 volts and use it as a source for testing transformers. It's internal impedance is so high that it will only get a little warm even with the output shorted. It's maximum voltage output is not more than 20 volts or so in any case. The toy train transformer that I use is around 5 inches by 3 inches by 2 inches. The output contriol is a lever. Modern toy transformers may have a lot more capacity so check your's out first

You find which leads are connected together using an ohmmeter and you can usually figure out the primary even when there is no color coding on the transformer leads. From there, it's a matter of connecting the model train transformer to what you think is the primary and setting the output to 11.5 volts. Check the other leads to find out what there output voltage is and multiple the results by 10 to get the real voltages with 115 VAC in.

Good luck, Harry, W3IIT

From: Robert Parker <rparker@sprint.ca>
Message-ID: <du2Z2.1158$r_1.844011@newscontent-02.sprint.ca>
Source record: 70459

I have an HF marconi ch150 solid state transceiver and i'm going to convert it to VFO by injecting the VFO signal into one of the crystal sockets. I was wondering if anyone has done this before and what there experience was. I realize the harmonics must be filtered before injection and therefore before I do anything, I will look at the O/P of the VFO on a spectrum analizer to determine the type of filtering required. If i'm lucky, no filtering will be required. This modification will be for both transmitting and receiving in order to give this rig more versitility. Marconi has made a very nice rig and I wish to have it on the air on nearly all the bands. Coverage of thie rig is from 2mhz-24mhz.
Second part of my query is: Does anyone know of any PC circuits that work to do the same thing as a VFO?
Perhaps a PC controlled function generator?

You comments and suggestions will be greatly appreciated.

Looking for information and parts on the Heath ID1590 weather station. Our controller is setup to interface with the Heath unit, but will consider other components.

Our organization is looking to add wind speed and direction to a repeater site. If anyone is parting out a weather station (Heath, Peet, Davis, others) we are interested in the anemometer and wind direction vane.

Thanks and regards, Hugh

You might want to parallel the PRIMARY windings, and series the SECONDARY windings. Also, be sure to check the isolation of the secondary winding from core, after you lift the low side of the winding. It may be that they skimped on the insulation at that end of the winding, knowing it would be grounded. If you have access to a Hi-Pot tester, you could check the actual breakdown voltage.

I have heard somewhere that core saturation may be a problems. Perhaps someone with experience can address that issue.

I just got ahold of a remote military antenna switch. It has connecters I have never seen before. They are approx 1/2 inch in diameter and the receptacle in the middle looks to expect a very fine wire or maybe the center conducter goes over these receptacles? I'm not sure. Can anybody help me identify this conecter?

Perhaps ,it is useful to add that many of these ball point pens are
made of polystyrene, at least the part around which the helical is wound.

Actually, there is a demand for obsolete parts, as replacement parts for maintaining older equipment. Price often depends on scarcity, and how much the equipment needing it is worth. A company called Trailing Edge Technologies makes a good living supplying obsolete parts to industry to keep their old equipment going. They're always hunting for old parts to stock for their customers.

I needed some RTL gates to repair a steel bender controller for a customer, and Trailing Edge had them. They charged me $5 each for them, but they were worth it because the machine would cost over $60,000 to replace with one using more modern parts. (Of course the controller could be replaced by one built using a $2 PIC, but the customer didn't want to pay what I'd have to charge him to design and build a custom controller for the bender. He just wanted what he had fixed.)

Hmmm. Without seeing it, cant say other than to guess. If it looks like a
larger
version of an N connector, then it may be a type HN these are threaded
around
the outside. If it looks like a BNC on vitamins and has bayonets on the
outside it may
be a type C connector. Both have smallish center pins in the connector and
both are
pretty much identical except for the way they fasten. (threaded versus
bayonet).

Anyone else out there with other guesses?

Source record: 70337
Cross-posted to:
rec.radio.amateur.equipment,uk.radio.amateur,rec.radio.amateur.homebrew,aus.radio.amateur.misc,rec.radio.amateur

I recently purchased a Kenwood ts570s. Great radio. I hooked up the remote din plug per the manual to key my homebrew grounded grid amplifier. My amp has a control line and when grounded it keys the amp.

Im using pins 2 and 4 on the din. At first it worked great and keyed the amp 4 or 5 times. Then it stuck in the on mode. It appears that I have approx 1 ohm resistance at all times across pins 2 and 4 which keeps the amp keyed. When keying the mic, it is keying the ts570 relay because I can see pins 2 and 5 opening and closing. I also see between pins 2 and 4 that it always has about 1 ohm but when I key it it reduces to about 1/2 ohm. This makes me believe the relay is working. On the diagram there is a 2200p capacitor (C286) across the relay contacts (pins 2 and4) My guess is that this capacitor has shorted showing the 1 ohm and when the relay keys, it keys across it reducing the resistance to 1/2 ohm.

The amp is a homebrew 813 (X3). The amp switching relay shows about 40 volts across the control line to ground. maybe this is too much voltage and shorted the small surface capacitor.

Any ideas? Can anyone send me a picture of where this 2200p cap C286 is located. I have looked on the board but cant identify it.

Please email me at tcmedlin@cris.com you will have to take the words "NOSPAM" out of my return address.

Thanks and 73,
Tom

I have a number of crystals for sale as follows - postage extra:

100kc frequency calibrator HCU $10.00

Amateur Frequency FT243 7125kc with a porcelain holder $5.00

Aprox. 40 HCU types that came with my SP600 up to 69mc. Im not going to list them. .50cts each. (yes I know the 600 only goes up to 53mc, but there are 10 the box over 53mc)Or all of them for $25.00

Aprox. 50 HC6 types mixed cb types, mostly HF types in the 8,10mc range, some cbs, and some over 30mc. $20.00 for all of them.

The Harmonic Research converter can be wired for sync on green, or separate composite synch (i.e. horizontal and vertical synch on a wire with no video), or separate horizontal and vertical synch wires. I used mine with a Conrac computer monitor with selectable synch rates using the RGB + composite synch setup. The Conrac synch settings were essentially CGA to make all this work.

> code to earn a award in his Tiger Cub Scout group. He is a seven year old
> that came to me to learn the code, and has no interest in radio,

Well why not FORCE him to learn about radio before he can use morse
code? It is ok for him to want to learn Morse Code and not anything
about radio, but not the other way around?!

I would
> think that anyone who is interested in radio should stop crying about it and
> donate the 15 minutes a night for 2 weeks, and learn it.

If your son doesn't have to learn or like radio to enjoy Morse Code,
then people who want to use or like radio do not have to learn Morse
Code.

> No one complains about having to learn how to use windows before they can
> surf the net....

Of course not, no one complains about having to learn how to use a ham
radio before surfing the repeaters either, but what if you made them
learn Russian before they were allowed to use the internet? Then you
would get the same complaints.

Larry,

I have a JPS ANC-4 noise reduction unit which works quite well for locally generated noise. It senses and feeds the offending signal 180 degrees out of phase into the radio which effectively cancels noise. It allows me to work RS15 where there is a terrible noise from my computer monitor on parts of 10 meters.

The best analogy would be having to learn Morse Code in order to use the internet, as Morse Code has as much to do with knowing how to operate and work the internet as it does with knowing how to operate and work a Ham radio.

I have great news for you! You CAN become a ham without learning Morse code. Looking at FCC Part 97, you can qualify for a Technician's license with only a written procedure and absolutely minimal theory test. No Morse code test!

It seems your wish has been granted, and quite some time ago at that. Run on over to your nearest VEC testing facility. There's no need to stop to thank me.

Michael.

True enough; however, it has everything to do with the es-prit de corps of ham radio. Knowing that one has gone through, and survived, the identical trials and tribulations of his or her counterparts, builds a unique bond of dedication and purpose. The instant gratification crowd of today has no appreciation for that bond.

Now that sounds like a plan, a Morse code test to get on the internet
would keep some of you no-code peckerwoods out of the DX newsgroup
and about a half dozen other ones this 'discussion' doesn't belong in.

Is it REALLY necessary to post this crap to every ham newsgroup there
is ? Some of us have already learned Morse code, we aren't looking for
any good reasons not to....

For different reasons, yes. A cheap CGA monitor doesn't have Analog RGB
inputs. VGA and EGA have different scan rates and won't properly display
at NTSC scan rates. Either the monitor won't run, or will burn out, or it
will display a side by side doubled picture.

>I am taking this to mean that the output is a composite
>signal and only if I have one of those cga monitors that also has a composite
>input could I use it?

The output of the Harmonic Research convertor is Analog RGB. If you
have a CGA monitor with a composite input, you don't need the converter.
Some monitors of that era did have both composite and RGB, and some
didn't. For example, the Zenith monitors for the Z-100 color machines
did, but (I think) the NEC Multisync didn't.

I'd suggest a short term rental of a newer TV and see what it looks like.
Most cheap TV's don't do much better than a VHS recording, so you won't
seen any real improvement until you spend some $$$.

4907. Marcone Xtal oven with 2 Xtals?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-09 00:00:00 UTC
From: Arjen Raateland <Arjen.Raateland@vyh.fi>
Message-ID: <373574B6.690E@vyh.fi>
Source record: 70357

Hello all,

I bought a surplus crystal oven of the type with an octal plug. It was made by Marconi and has sockets for two crystals. The oven has a plain aluminum cover which is marked on top:

Marconi
W.44530 ED.A

1. kc/s
2. kc/s

The oven came with two crystals marked:

4000 kc/s
MARCONI
Q01670A
XLC75C

6000 kc/s
MARCONI
Q01670A
20/75/30

The oven has a bimetal switch, I assume, and it appears to work well on 12 Vdc. I just connected the oven such that the switch is in series with the heater element. Heater current is about 500 mA at 12 V. I haven't measured the temperature inside, but the heater cycles on and off.

Looking in the literature it seems a crystal for use in an oven is usually cut such that the frequency goes down when the oven heats up. The frequency starts to go up again past a certain temperature, which is the temperature the oven should maintain.

Well, I measured the heating up characteristics of both crystals in this oven and found that the 4 MHz Xtal goes UP and the 6 MHz Xtal goes DOWN in frequency when the temperature rises from room temperature to the point where the oven starts cycling on and off. This behaviour seems strange. The difference in frequency is tens of Hertz.

My test oscillator is actually my FET dipmeter which I couple to the Xtal and adjust till it locks as seen on a frequency counter. In my setup the 4MHz Xtal is ca. 2 kHz high and the 6MHz ca. 2 kHz low. Strange ... my counter time base may be off a little, but not by that much.

While the oven cycles the frequency keeps going up and down a few Hertz. (I know the counter is just a garden variety, but the oven cycling is

rather quick and the counter sits in comparatively steady circumstances.) The Xtals in this oven don't seem to be such a good combination to me.

Does anybody reading this recognize this type of oven and it's Xtals perhaps? Any information is very welcome.

Could it be that the stability (0,3 ppm) indicated by the seller will be attained by adding or subtracting the two frequencies? (Originally only a 4MHz Xtal was supposed to be included, the 6MHz one was a 'bonus'.) I've never heard of such a scheme, but who knows, the temperature coefficients are clearly opposed in sign between room temperature and oven temperature.

Any information on this subject very welcome.

4908. Help iimproving audio output circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-09 00:00:00 UTC
From: BarryG <bgNOSPAM@albany.net>
Message-ID: <7h2lbp$8kd$1@news.monmouth.com>
Source record: 70467

Would appreciate hearing from those with the passion and experience of reworking the receive audio circuitry of rigs to improve the audio quality. I loved the audio quality of my old TS930, and am switching over to an Omni 6+ which needs a little audio magic worked into it. I'll be replacing the Ten-Tec 2.4khz filters with Inrad 2.8's and have been eyeing the schematics for additional improvements.

The following is in the audio signal path:

5 polarized caps
4 op amp stages of the notch filter IC (all the time -not bypassed with a switch)
MC14066BCP analog switch IC
TDA2611A audio amp IC

If someone could point out the relative degradation (or lack of) caused by these components and perhaps suggest means of improvement, it would be gratefully received. BTW, I use a Heil Pro headset for listening, which sounds fine with the TS930.

Tnx & 73,
Barry N1EU

I am building a power supply for my 50mhz amp. I need around 3000v for B+. I was talking with another ham, and electronics shop owner, and we kicked around using old microwave oven transformers for a plate supply. We would parallel the secondary windings, series the primary windings, and have about 4kv before rectification. Of course, you would have to lift one side of the secondary from the chassis (most are attached at the frame of the transformer), but it sure does seem do-able. Any thoughts, pro or con?

Help !!!

I am trying to ascertain the specification (upper freq in particular)of
a component which I believe to be double balanced mixer type # MD-139.
I'm fairly sure that the logo is that of Anzac Electronics, but as I
can't locate their web page, I assume that they are no longer trading
under that name.

The package is 15mm x 15mm x 2mm (5/8"x 5/8" x 1/16") and has 10 pins.
LO is pin 6 and the RF/IF ports are pin 3/10.

Can any one assist ??

Thanks

I'd be careful about the insulation but the magnetic shunts
(two bundles of laminations between the windings should be
removed with a pin punch (or similar). That's what causes the
core saturation AFAIK.

The reason for paralleling the secondary windings was the assumption the 4kv out would be 2kv if you series the primary windings. (IE: 55v at each primary vs 115v) Your last two points are good ones. I don't know about the core saturation, either. I hope someone may.

>rectification.

So these are about 2kV transformers. Off-load from a single transformer,
you'd get about 2.8kV, but this is likely to sag down towards 2.5kV
under even a moderate load. This is not good, because it will make your
amplifier very liable to "flat-topping" and splatter on speech peaks.

>Of course, you would have to lift one side of the secondary
>from the chassis (most are attached at the frame of the transformer), but it
>sure does seem do-able. Any thoughts, pro or con?

If you lift the inside of the transformer winding from the frame, what
about insulation? With a bridge rectifier, the inside of the secondary
winding will swing to 2.8kV. This is not a good idea for insulation that
was designed for zero voltage!

If you series-connect two secondaries, with the primaries in series too,
that doesn't achieve anything. It only increases the effective primary
and secondary resistances and makes the regulation poorer still.

If you're determined to use these transformers, the best bet is a
"center-tap" configuration with the insides of the secondaries connected
together, and the primaries paralleled in opposite phases.
Don't forget to knock out the magnetic shunt blocks between the
windings, which are designed to cause core saturation and limit the
current drawn by the magnetron. Even so, the regulation will be poor
because each transformer is in a half-wave rectifier circuit with a DC
magnetizing current that will still cause early core saturation. Use
plenty of reservoir capacitance (25-30uF) to help the voltage regulation
as much as you can.

Don't commit yourself to building an amp or even a power supply around
these transformers before you have tested their performance in a real
rectifier circuit with real loads.

Going to direct video feed will likely offer a substantial improvement in
picture quality. You don't need to buy a new TV to get that, however. It
is a relatively easy modification to "jeep" a TV to accept direct video
input.

What you need to do is add a switch in the line between the demodulator
of your TV and the first video amplifier. This lets you select either demod
video or a direct video feed you add with a jack in the back. This is basically
how TVs with a direct video input work.

Note that there is a potential hazard to doing this if your TV is a transformerless
model. The chassis can be "hot", and connecting the external video cable shield
to it could present a shock hazard. But if your TV uses a transformer power supply,
even a switcher, it should work fine. If you know what you're doing, you can jeep
a hot chassis set successfully using isolated ground technique, but there is some
risk involved.

That should help. You might want to look at AC line filtering too. Some of your
noise is probably getting to the radio that way.

>There's so much machinery around that a widespread noise suppression program
>at the sources would be pretty costly, so I'm trying to pinpoint only the

Suppressing industrial sources can be difficult (and dangerous if you don't
know what you're doing, enlist the aid of an industrial electrician).

>What HF xcvrs do you recommend for their superior noise blanker performance or
>combination NB + DSP results?

I can't say much about new transceivers. I know one which *isn't* properly
designed. That's the IC-706. Its noise blanker pickoff is after the first narrow
filter, and doesn't work well at all. I modified mine to move the pick off to before
the first IF filter and it works better. My old IC735, which does have the pick
off before the first IF filter, works pretty well too. Ideally you want a radio which
has a front panel adjustment for the blanker sensitivity, and for blanker width
too. When the Russian Woodpecker showed up on the bands, there was a
good bit of interest in this topic, and some radios were built with adjustable
noise blankers to handle it. That seems to have been forgotten in recent
radios.

Audio level DSP can mask noise, but it has already done its dirty work by
pumping the receiver AGC, so that isn't a very satisfactory solution. DSP
at the IF level *should* be better, but that depends on the implementation.
I just don't know enough about recent IF DSP radios to comment on which
one does the best job against electrical noise.

Isolation transformers are cheap. Go ahead and build your AA5, but add an
isolation transformer for safety.

>how to acquire that "what"?

Well, the rinky dink testers work fine. The idea behind them is simple. They
measure the potential between the conductors, using neon bulbs and ballast
resistors. Between hot and neutral, there should be 110 VAC of course. Between
hot and safety ground, there should also be approximately 110 VAC. Between
neutral and safety ground there should be a very low potential. The testers
are configured as standard plugs, so they make sure that hot, neutral, and
safety appear on their proper pins. The bulbs tell the story.

As Roy said, the round pin is safety ground, the wide blade is neutral, and the
narrower blade is hot. The purpose of testing is to make sure that they're actually
wired that way. In practical terms, it usually doesn't matter much if safety and
neutral are swapped (though that's a Code violation, and could be a hazard if
the bond in the entrance panel were to open). But it matters a lot if hot is swapped
with either one of them.

The handiest tool I've found to test outlets is called the Volt Pen. It is a plastic
encased tool with a plastic blade sized to fit the hot slot on an outlet. You
hold it in your hand and insert the blade in the slot. A neon bulb inside glows
if the slot is hot (it uses hand capacitance to complete the circuit). It won't
glow when inserted into the neutral slot, or when brought next to the safety
ground (assuming that they're wired correctly). What makes this tool so handy
is that it also works when brought near a wire. Bring it near a hot wire and it glows,
bring it near a neutral or safety and it doesn't. This helps you identify hot wires
without having to actually contact them, and also lets you know whether a circuit

is hot or not before you work on it. Most electrical supply houses carry them.

<snip>
>Any other thoughts on this?

Issue #1: While frequency responses from speakers are designed to be
flat, I'm not sure the microphonic response will be the same
(excitation from the coil is not the same as the sound exciting the
cone and moving the coil). And since the microphone frequency and
phase response needs to be very well controlled and characterized, I
think it would be difficult getting this to work.

Issue #2: The output amplifier applies volts to the speaker, and the
microphonic response is measured in microvolts. If you can build a
differential microphone amplifier with the low noise and high dynamic
range required to handle these two extremes, you should apply for a
patent.

Get past these two design headaches and you might get somewhere, but I
doubt you'll improve on the performance of existing ANR headsets.

A lot of the Icom radios use a condenser microphone and require some voltage to function. Most of the time this voltage is also sent up the audio lead. Maybe your signal generator is working against this DC level. Might try isolating the DC component with a capacitor?

A couple of things to remember for testing transformers at hamfests --

It's a lot easier if you have clip leads (not probes) on your
pocket VOM, so you can get a better contact on old grungy wires.

You want a fairly sensitive VOM -- at least 20K ohms/volt -- so you can
tell if you're seeing a true open, a true short, or your own skin
resistance. Make sure it has a good battery.

In general, winding resistance is inversely proportional to voltage.
A 1 K-ohm winding is going to be a high voltage winding, a 0.5 ohm
winding is going to be a low-voltage winding. That, along with color
coding, will get you in the ballpark to guess what you've got.

You want NOT to use a continuity light for testing transformers. Why?
Consider what you have when you hook up a 3 volt light to a 5 volt
secondary on an old TV transformer. A circuit, right? Yeah, and
when you disconnect the light, you break the circuit and you release
the charge in the transformer. If you're touching the high-voltage
secondaries, I guarantee you'll know it. You would probably rather
go a few rounds with the ol' wouff hong.

When you bench-test a transformer, it's a good idea to put a 100-watt
light bulb in series with the primary. If you have a problem, the
light will come on. This will work through a variac, too -- problem
for some of us is that we don't have a variac.

You can use old car headlights in series/parallel to test low-voltage
windings for current. Add in more headlights to draw more current.
Junkyard headlights are typically 60 watt units, so if you're testing
a 12-volt winding, expect to see about 5 amps per headlight filament.
You'll have your max current rating when the output voltage starts to
sag.

White LED???

Don't think I have ever heard of one.

The other post mentioned LEDs in a clear plastic dome, but the LED itself will still have some color. Because of how LEDs work (quantum physics stuff, which I won't go into here) they all have some color to them.

Many years ago the only thing available was red, since that is the easiest to make. Since then, those guys who stay awake at night worrying about such things have come up with ways to make many different colors.

If you really want 'white' one you could get several different colors and operate them at the same time, but it would be cheaper to get a plane ol' light bulb.

What Grogancat recommends is hazardous -- potentially lethal to an unsuspecting user if there is ANY possibility of somebody plugging it in wrong and then contacting the hot chassis. If one builds a potentially hot chassis instrument, the only responsible thing to do is to put it in an enclosure that completely prevents any contact with the chassis or anything connected thereto. Only an ablsolute hermit ham can hope to get away with the consequences of building a death-trap, and only if his memory does not fail!
Apart from that, it is obvious that Grogancat built a great learning project.

My understanding of why we still have morse code as a requirement is simply because of international agreements. In order to work DX, the ITU still requires a code proficiency. What speed varies with the country issuing the license, so the FCC could easily reduce the speed, but there would still be the minimum requirement.

I consider myself an "appliance operator" and haven't used code for a long time. I am one of those that would like to see it dropped as well. We are not preserving a tradition, trying to keep anyone out, or making ourselves an exclusive group. Amateur radio should advance the radio art, have a trained pool of operators for emergencies, and improve international relations. These can be done without CW, but until the ITU changes its policy, the FCC has no choice.

The white ones incorporate a red, green and blue chip on the same package,
with two leads. The white balance can vary a bit but it's usually OK for
casual usage.

I've never seen a 4-legged one with separate controls for red/green/blue,
but they do exist as I saw them in a moving-words sign at Disney that was
full color.

Subject: ** FLEA at MIT ** Sunday May 16th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday....

Sellers Season Passes will be still be sold however, NOW is the
time to send in your season pass applications if you want to be
in the prepaid line, which will be admitted first.

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 16th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all

sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

Actually some of the white ones are a high intensity blue, with a phospor
coating. If you squint you can see the bluish tinge to the white, but it's
certainly closer to white than, say, an incandescent bulb.

Hello--
Not to muddy the waters, but I've seen samples of stamped-lamination
toroidal cores that consisted of washer-shaped plates, stacked and
wrapped in insulating tape to form a flattish toroid. I have no idea
what the end use of these cores would be-- probably somewhere cheap
and disposable<g>.

4949. Any ideas for a radio booster?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-10 00:00:00 UTC
From: Slip <slipnfall@waconet.org>
Message-ID: <7h81iu$1ff5@enews3.newsguy.com>
Source record: 70258

Hi there,
My appologies for the amateur question(well, I guess this *is* the amateur NG), but I would like to know how hard it would be to build a small radio booster. My home stereo is a Philips FW-316C to be exact. The antena input is an FM Aerial 300ohm T-type jack(two input jacks). Currently there's a 10' y-cable antena stapled to the ceiling, but I still get lowsy reception. I'm currently a sophomore at a local vo-tech school and *do* have electronics experiance(so don't worry with describing components, etc). I was thinking of something similar to those cable-tv boosters which rely on the AC line. Is there a way to possibly do this with FM signals?

If this NG is not the apropriate one to be posting this to, please e-mail me personally and suggest a better one.

Thanks for any help you may be able to offer!
-Jamie

4953. HELP: TS520 INTERNAL digital display

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-10 00:00:00 UTC
From: "Paul A. Elliott" <n7ijb@gte.net>
Message-ID: <DttZ2.5786$ax4.339885@dfiatx1-snr1.gtei.net>
Source record: 70361

I recently bought a TS-520 that has an internal digital display !!

I need a circuit diagram for the display board's.

(I know they didn't make such a critter) however this one has the display and the Henry Radio receipt that was in the manual and is dated 12/11/75 says (1) Kenwood TS520 DIGITAL. the receipt also says in the margin, Note: customer to return radio for modification after Jan 1, 1976 so I am assuming that Henry Radio provided this mod.

The additional circuit board's are definitely not home grown.

I have also emailed Henry Radio but after almost 25 years I figure most of the Henry employees would be gone and it is more likely that there is a ham out there that has info on this mod. Covering all the bases!

The radio works fine but the display which has (4) led's is on but does not change reading while tuning.

Any information would be appreciated.
Thanks

Paul N7IJB n7ijb@gte.net

Agree!

> And speaking of slower speeds, people that copy only
> in their heads have difficulty with copying 10 wpm qsos.

And with that: Too slow and you cannot copy words, only letters; then I must write it all down.

Phil

You really do need a visit to news.newusers.*. Sale postings are forbidden in all Usenet newsgroups outside biz.* unless the charter specifically allows them.

But you're not talking about an innocent sale posting or two. You're talking about some "new market", as if our computers are your personal advertising space.

> > As a matter of fact, newspaper switchboards

All Electronics Corporation (los angeles area) - in their catalog - they
are a clear lense (not diffused) so my use of one as a panel indicator
wasn't very satisfactory (even at 1 mA it is still MUCH too bright);
they are about $4 each the last time I looked at their catalog.

4962. Old Transformer & Choke value

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-10 00:00:00 UTC
From: John Skapiak <jskapia1@twcny.rr.com>
Message-ID: <xzzZ2.10256$8m5.18935@newsr1.twcny.rr.com>
Source record: 70370
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I have the following old transformers, chokes, and coils and I'd like to get an idea of what they might be worth.

UTC - S-58,S-60,R-107,F-7071,FT-4,R-19,R-20,H-24, and HQA-200 with box and spec. sheet.

Thordardson - T-21FO5, T-55180 B-7489102, and a T87C49 or T67C49 (difficult to read first letter)

Any information or assistance would be appreciated.

Thanks,

John K2SY

>right now!

There are two reasons why it "sounded just fine".

One is the transformer / power supply issue. It certainly IS possible to use these transformers successfully in a linear amplifier, if you don't drag the voltage down by being too greedy for power output.

The other reason is that on-frequency audio quality reports tell you nothing useful about the linearity of a power amplifier. The distortion from a non-linear amp appears mostly OFF-FREQUENCY in the form of wideband splatter. Even if you're spreading splatter across the band - and across the world - the people you're working on-channel will still be saying "sounds just fine".

Try testing with local stations on a dead and empty band. Ask them to tune away either side of your frequency, and to tell you how wide your signal is before it disappears into the noise. You'll be surprised how badly an amplifier can be spreading, before it has any noticeable effect on the audio quality.

You will probably, almost certainly, have to modify the oscillator
circuit to eliminate the feedback path that made it an oscillator.
Depending on the circuit, that will entail removing a capacitor or
grounding a source/emitter/cathode or something of the sort.

There is a company in Florida, Bytemark, that sells a very nice little
PC card that puts out about 5 dBm up to 54 MHz that is very clean, at
least on my spectrum analyzer, and the price is reasonable. They have
a web page at http://www.bytemark.com

Good luck, Rob.

Just to let everyone know, I finally got a tuned rectangular loop to work pretty well. I found a calculator for inductors that included rectangular loops at about the same time I discovered Harry Lythal's (SM0VPO) website "VHF test antenna." (http://www.geocities.com/SiliconValley/3569/) A few calculations and much bending of #12 wire to fit the space produced a sharply-tuned antenna that performed about 10dB better than anything I'd found up to that point. It's still cut-and-try but the results are very gratifying!

Thanks to everyone who suggested things and gave support!

Source record: 70378

David,
Use a 1 kilohm (not critical) potentiometer and a 0.05 to 0.1 microfarad capacitor. The speaker circuit wants to see a low Z load (usually 4 to 16 ohms) so you might consider shunting the whole pot with such a resistor if you disconnect the speaker with this connection. I suggested the 1 k pot rather than a 4 ohm pot, because it is much easier to find. If the audio source is a tube set, the low Z load is important, but transistors (in the usual output-transformer-less circuit) will not mind the higher Z load. The electret microphone is probably pretty Hi-Z, so I calculated the capacitor to have 10K reactance at 300 hertz. If the electret circuit is much higher impedance than my 10 k guess, your 3 decibel bass cutoff will move down proportionately -- good for hi-fi but bad for the risk of hum problems. You may feel free to try different values of capacitance to move the low frequency response. More capacitor = more bass. Hope this helps!
73 de Allan Kaplan, W1AEL.

You are aptly named, "Squirrel"! I believe Roy's note was a bit more moderate and polite in tone than your response. rec.radio. amateur.homebrew is NOT about beer, as a reasonably careful reading of the newsgroup name should suggest. While we cannot prevent beer posts, and many of us enjoy beer, this NG is NOT the intended audience. "Homebrewing" has a very well-established meaning to radio amateurs, and goes back every bit as far as as internet communication about beer-making. We can coexist in gentlemanly fashion; we can raise our glasses to each other; but we should observe the civilized conventions of good Net citizenship and not post without lurking to see what the group is all about. Your note strongly suggests that you can read and think clearly -- we wish that others would do as well. Here's mud in your eye -- cheerio!
Allan (I drink some, but my son is the Brewer)

What you are describing is a type of open-loop noise cancellation where the noise sensor is located outside the headphone. Not as good as closed-loop, but still fairly common - although the sensor is usually a microphone.

Take a look at these articles on the HeadWize site for info:

Active Noise Reduction Headphone Systems:
http://headwize.com/tech/anr_tech.htm

Build These Noise Cancelling Headphones:
http://headwize.com/projects/noise_prj.htm

If you decide to implement the system you propose, consider writing an article for HeadWize.

: >responded. I am now thoroughly put off the cheapskate idea of trying to build
: >my little glowbug projects sans transformers. The one-hand-in-back-pocket rule
: >is one worth following in all cases.

: Isolation transformers are cheap. Go ahead and build your AA5, but add an
: isolation transformer for safety.

: >Now, a more general and corollary question about AC house wiring: what is the
: >proper method of testing outlets to determine if they are wired correctly,
: >especially with respect to the third/ground wire? RS and other retailers sell
: >an overpriced rinky-dink tester of dubious value. I'd rather learn something
: >and save my money.
: >
: >I am almost certain that with the right procedure and a good DMM (or a simple
: >and inexpensive home-brewed tester) I should be able to get more information
: >of a higher reliability, but the question remains: what am I looking for, and
: >how to acquire that "what"?

: Well, the rinky dink testers work fine. The idea behind them is simple. They
: measure the potential between the conductors, using neon bulbs and ballast
: resistors. Between hot and neutral, there should be 110 VAC of course. Between
: hot and safety ground, there should also be approximately 110 VAC. Between
: neutral and safety ground there should be a very low potential. The testers
: are configured as standard plugs, so they make sure that hot, neutral, and
: safety appear on their proper pins. The bulbs tell the story.

: As Roy said, the round pin is safety ground, the wide blade is neutral, and the
: narrower blade is hot. The purpose of testing is to make sure that they're actually
: wired that way. In practical terms, it usually doesn't matter much if safety and
: neutral are swapped (though that's a Code violation, and could be a hazard if
: the bond in the entrance panel were to open). But it matters a lot if hot is swapped
: with either one of them.

: The handiest tool I've found to test outlets is called the Volt Pen. It is a plastic
: encased tool with a plastic blade sized to fit the hot slot on an outlet. You
: hold it in your hand and insert the blade in the slot. A neon bulb inside glows
: if the slot is hot (it uses hand capacitance to complete the circuit). It won't
: glow when inserted into the neutral slot, or when brought next to the safety
: ground (assuming that they're wired correctly). What makes this tool so handy
: is that it also works when brought near a wire. Bring it near a hot wire and it glows,
: bring it near a neutral or safety and it doesn't. This helps you identify hot wires

: without having to actually contact them, and also lets you know whether a circuit
: is hot or not before you work on it. Most electrical supply houses carry them.

: Gary
: Gary Coffman KE4ZV | You make it |mail to ke4zv@bellsouth.net
: 534 Shannon Way | We break it |
: Lawrenceville, GA | Guaranteed |

I agree about Volt Pens...they are quite handy, but just so you know,
these do not use a neon bulb...it's a LED driven by a high-gain op-amp.
There may also be a version that uses a FET of some sort, but the op=amp
version is common.
One thing to keep in mind about volt pens, is that they will flash on
static as well as current electricity, which can(but usually does not)
cause confusion.

: Most cheap TV's don't do much better than a VHS recording, so you won't
: seen any real improvement until you spend some $$$.

: Mark Zenier mzenier@eskimo.com mzenier@netcom.com Washington State resident

One hint....look at junk shops/flea markets for old Commodore
monitors-many of them have composite inputs(and generally the sellers do
NOT realize this, so they tend to underprice them).
One model to look for is the 1909.
If working well, they give a VERY good NTSC picture indeed, in fact, often
better than the average TV set.

If you find a different model, look for a composite jack(RCA, usually),
and a switch, used for changing modes.
Also, if you get one working, but all you get is green, look for another
slide switch...it was intended to mimic the older green-screen monitors in
one position, and give color in the other one.
Not knowing about this switch can lead to needless troubleshooting!

Dear Future Associate,

You Can Work At Home & Set Your Own Hours. Start earning Big Money in a short time

NO Newspaper Advertising!

Your job will be to stuff and mail envelopes for our company. You will receive $.25 for each and every envelope you stuff and mail out.

Just follow our simple instructions and you will be making money
as easy as
1 2 3

For example stuff and mail 200 envelopes and you will receive $50.00. Stuff and mail 1000 and you will receive $250.00. Stuff and mail 2000 and you will receive $500.00 and more

Never before has there been an easier way to make money from home!

Our Company's Home Mailing Program is designed for people with little or no experience and provides simple, step by step instructions.

There is no prior experience or special skills necessary on your part, Just stuffing envelopes.

We need the help of honest and reliable home workers like you. Because we are overloaded with work and have more than our staff can handle. We have now expanded our mailing program and are expecting to reach millions more with our offers throughout the US and Canada.

Our system of stuffing and mailing envelopes is very simple and easy to do!
You will not be required to buy envelopes or postage stamps.

We will gladly furnish all circulars at no cost to you. We assure you that as a participant in our program you will never have to mail anything objective or offensive.

There are no quotas to meet, and there no contracts to sign. You can work as much, or as little as you want. Payment for each envelope you send out is Guaranteed!

Here is what you will receive when you get your first Package. Inside you will find 100 envelopes, 100 labels and 100 sales letters ready to stuff and mail

As soon as you are done with stuffing and mailing these first letters, your payment will arrive shortly, thereafter. All you have to do is to order more free supplies and stuff and mail more envelopes to make more money.

Our sales literature which you will be stuffing and mailing will contain
information outlining our highly informative manuals that we are advertising nationwide. As a free gift you will receive a special manual valued at $24.95, absolutely free, just for joining our Home Mailers Program.

Plus you will get your own special code number, so that we will know how much you are to get paid. And to make re-ordering of more envelopes, that our company supplies very simple for you.

We are giving you this free bonus because we want you to be confident in our company and to ensure that we will be doing business with you for a long time.

Benefits Of This Job:

1. You do not have to quit your present job, to earn more money at home
2. You can make between $2,500 to $4,500 a month depending on the amount of time you are willing to spend stuffing and mailing envelopes
3. This is a great opportunity for the students, mothers, disabled persons or those who are home bodies.

To secure your position and to show us that you are serious about earning extra income at home we require a one-time registration fee of $35.00.
This fee covers the cost of your initial start up package, which includes 100 envelopes, 100 labels and 100 sales letters and a manual, your registration fee will be refunded back to you shortly thereafter.

Money Back Guarantee!

We guarantee that as soon as you stuff and mail your first 300 envelopes You will be paid $75.00 and your registration fee will be refunded.

Many of you wonder why it is necessary to pay a deposit to get a job. It is because we are looking for people that seriously want to work from home.

* If 3.000 people told us they wanted to start working from home and we sent out 3.000 packages free to every one. And then half of the people decided not to work, this would be a potential loss

of more than $60,000 in supply's and shipping that we have sent out to people that don't want to work

We have instituted this policy to make sure that you really want to work and at least finish your first package.

To Get Started Today Please Enclose Your Registration Fee of $35 Check,Cash Or Money Order and fill out the application below and mail to:

AHWA CO
Pmb

I'd REALLY like to find this kind of LED, (the 4 leg kind.)
All the different white LEDs I have they all pump a phosphor
from another color source, usually blue,
in some cases an IR LED can pump up a phosohor.

You will certainly find a strong intest in the Ham Radio magazine on CD. I threw out all my Ham Radio magazines (except the ones I wrote articles in) about 10 years ago - and am sorry that I did!

Please keep us advised as to when the CD(s) will become available.

You need better bypassing (proto board? Ugh!) and better
grounding (ditto...) on the CA3338. I built a DDS some
years ago that uses a Qualcomm Q2220 DDS chip and a
CA3338 (Techno Whizzy, 73, December 1991), and the bypassing
on the CA3338 ended up being capacitors soldered right
on the pins. Lead length: zero.

It works perfectly, and has recently found new life as the
VFO for some HF WEFAX stuff I'm playing with...

YES!

Every now and then I've even toyed with seeing if the
microfiche version was still available, but I recently
picked up a couple of QST CDROMs and see that this is
the way to go.

Put me down for a copy.

If everybody misses _ham radio_ so badly, why aren't the
present-day techie ham magazines (QEX, Communications
Quarterly) doing better?

4984. NEWBIE - Seeking Advice

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-11 00:00:00 UTC
From: Alex <mathcsstudent@somehw.com>
Message-ID: <37380941.3F0BA857@somehw.com>
Source record: 70271
Cross-posted to:
rec.radio.amateur.misc,alt.tv.tech.plain-tv,rec.radio.amateur.equipment,alt.radio.digital,rec.radio.amateur.homebrew

I am a university math/cs student. Years ago I learned how to program GPIB
devices (using a library) and custom RS-232 to switch a device on and off.

I'd like to get a DAC/ADC card that would be suitable for capturing analog (NTSC and FM/AM) signals for use as a PC card. The idea is as much in software as possible, including interpretation of color bursts, carriers, etc, treating
a digital clipped signal as a bitstream, and control of frequency tuning. Just a plain vanilla DAC/ADC with a plain vanilla driver. This I believe would be a similar
setup to the converter included in NeXTStep PC's. (?)

I'm seeking advice as to what I need "on the other side" of the card to control
gamma correction/gain, and especially basic analog knowledge as pertains to
communications equipment. I know *of* these things, not any specifics. Any
suggestions/directions?

Thank you in advance.

I had one of these units and it is very nice. Check to see that the
crystal oscillator is operatiog. I think it is 1 MHz. See that the VFO
output is connected to the input of the counter board. Trace the signal
through the counter chain useing a scope or a second counter. My TS-520
was purchased from Henery new with the counter installed. It did not
come with a schematic. Kenwood got an injunction against Henery to
prevent the sale of these units because Kenwood was comming out with the
external counter design. The Henery units are very rare and I do not
think there are more than fifty.

> Thanks for any help you may be able to offer!
> -Jamie

The first thing to look at is the antenna. If you can get the reception you want with just wire, that's the way to go! Orienting the folded dipole you have now can likely improve reception (at least on some stations), assuming that it's been accurately cut for the FM band. It's easy to build your own out of 300-ohm twin lead. If the signals are still noisy (you must be in the fringe area for all stations!), getting the antenna out of the building and in the clear is the next step (even just out the window can help). Next after that, would be multi-element ("beam") antennas, which you can make out of wire or even copper foil strips on a sheet of mylar or even cardboard. Those need a bit more space, but I've built some that I've just taped to the ceiling, pointed in the right direction. All these antennas can probably be found in any edition of the Radio Amateur's Handbook (just scale them for the FM band).

After exhausting all those passive options, THEN I'd consider an active booster.

Good luck!

Anzac got absorbed into M/A-COM several years back, Rod. I shall look to see if I can find one of my old catalogs, so that I may be able to send you a data sheet copy if I am successful. AMP, the connector company, bought M/A-COM a few years ago, but I doubt that complicates the situation. I believe we will find that the MD-139 is a decent double-balanced mixer for ham purposes.

Source record: 70385

Well this antenna which came with the stereo is of course the cheapest you can get. To me it just looks a piece of zipcord shielded wire split half-way down the middle. :-) One thing that I have done that actually does improve the reception is to attach one end to an AC outlet ground. Wouldn't this, in effect, be extending the antenna throughout the entire house? Another idea which came to me was to attach the antanne to the shielding of an air TV-antenna...(we have cable, so it's never used). Am I talking out my rear here or are these logical choices? I know grounding to the AC ground isn't smart due to the fact if something shorted, I'd have AC into my stereo for a short amount of time.

Thanks again for the suggestions!!

hello ,

I just got a grundig tube type of 1960 radio with
ECC85 in the front end and a conventional
ECH81/EBF89 IF stages followed by ratio detector.

This radio works rather well and it is surprisingly
sensitive.

It seems that the a neutralized triode is used
as the RF amp followed by a self oscillatting triode convertor.
both of these triodes are contained in one 6aq8/ecc85 tube.
I suspect that a 6dj8/ecc88 would have worked as well but NOT
a 12at7/ecc81.

I was toying with the idea of reverse engineering the design
of such a RF front end. The circuit is readily available
at http://www.vintage-radio.com/ goto the 1955-1956 link at the
bottom.

After going through the explanation, I still have the following
questions:-

1. How is the RF grid-cathode coil designed oscillattor coil designed
where is it tapped at ?
How does it exactly work, what is the purpose of grounding
the tap of the rf-grid-cathode coil via a unbypassed 120 OHM resistor
instead of directly.

2. How is the oscillattor coil designed ?
what is the pri-sec turns ratio and the tapping points on the primary.
How is the frequency stability acheived ?
(This oscillator is surprisingly , very stable .)

3. What are tradeoffs of using a self oscilatting triode convertor ?
Why wasnt a single pentode used at AM ~1000 KHZ frequencies
as a self oscillating convertor instead of the pentagrid tube like
ECH81 or 6SA7 ?

4. How to model this circuit in SPICE ?

This circuit is one of the most interesting circuits I have seen
for a long time and i would really like to duplicate it with
fire-fets and J310 fets .

thanks .

>I also have several PMR radios and worked out the relationship between the transmit/receive frequencies in one particular set: one crystal was multiplied by three to be 10.7MHz below the Rx frequency, while the other crystal was one 6th of the transmit frequency. Perhaps david may be able to do the same: most PMRs have a plate inside with transmit and receive frequencies marked, and the crystals can be examined. Is it possible to change the crystals and retune appropriate stages without technical information? For example, I have an old Tait PMR which has all stages, such as Tx oscillator, multipliers, buffers and PA stages marked on the PCB. Could I tune up with new crystals with this info?

Because they generally aren't very good. Ham Radio had a
strong editorial hand with a clear sense of what it was about
and where it was going. That's lacking in the magazines that
have tried to fill its place.

Hooking up to the AC wiring isn't a very good idea. But if you have an
outside TV antenna that isn't being used, hook it up properly to the
radio and it should be just dandy. The FM band falls between TV
channels 6 and 7, so an outdoor VHF TV antenna makes an excellent
FM broadcast antenna. Disconnect the present antenna and hook
the TV antenna up to your radio. If the stereo has a 75 ohm coax
connection available, use that, otherwise you need a 75 ohm to
300 ohm matching transformer (available at Radio Shack) to let
you properly connect the coax from the TV antenna to the screw
terminals on the radio.

>I really need info on the RCA 8890 tube, If anyone has any info it would
>be a big help

Our two generations back TV transmitter, a RCA TT50H, used those in the visual driver and in the aural PA. It is a ceramic metal tetrode. It used BeO as the ceramic, very toxic if you breathe or ingest the dust. As I recall, they ran at 4 kV with about 1.25 amps of plate current in the aural PA. I think screen voltage was around 1 kV and grid bias was about -65 volts. Drive for the aural (Class C FM) was 80 watts for 5 kW.

I *think* the filament voltage was specified as 6.0 volts at about 150 amps. Exact filament voltage was critical to tube life and emission. We only ran enough to get the power we needed. As I recall, we'd start a new tube at about 4.8 volts (back bombardment supplied a good bit of cathode heating at our operating frequency). That had to be periodically cranked up as the tube aged until we were running full voltage when the tube had about 20,000 hours on it (few made it that far without shorting).

I'm pretty sure we don't have the books on that old transmitter anymore, so that's about all I can tell you other than that they were very prone to grid to cathode shorts. The element spacing was very narrow to get the high gain at VHF, a touch too much heat and the tube would short as the grid sagged into the cathode.

Obviously, this tube was designed to run in a cavity, and that had to be very carefully designed to avoid parasitic oscillations. When the TT50H was new, RCA had to make several field modifications to the cavities to tame that problem. As with any other compact high power tube, lots of cooling air was required. As I recall, the TT50H used 5 hp 3 phase blowers, and those had to be running even when only filament power was on (and for 5 minutes after it was turned off).

I don't think this tube is very suitable for amateur use. It has so much gain that it is hard to control, and it isn't forgiving at all of tuning mistakes.

I am looking for details on how model airplane
radio links and servo systems operate in detail.

Information I would like to know is.

What frequencies are used?
How many channels are available?
What is the RF bandwidth?
What is the modulation type?
Does there exist any books with typical schematics
and circuit details that might explain the above.

Any help will be appreciated.

It sounds to me as if the two crystals that where sold with the oven may just be surplus to the seller and not necessarily designed for use with the oven they where selling.

For example with a 75 Deg C oven and a crystal designed for use at 75 deg C, the crystal will drift DOWN in frequency as the oven warms up until the crystal reaches its high temperature turning point. The high temperature turning point of the crystal should coincide with the oven temperature so as the oven cycles within a narrow temperature range the crystals temperature coefficient will be very small and the frequency drift with temperature will be small.

You cant just put any crystal that will physically fit in to an oven and expect good temperature stability. In fact a crystal not designed for oven use may actually be less stable when operated in an oven.

I see your point - QEX and Communications Quarterly both
seem more to derive their identity from other sources
("too techie for QST" and "successor to Ham Radio",
respectively) rather than make their own way.

Confession: I don't subscribe to either magazine. If
the current Communications Quarterly looks good, I buy
it at the bookstore. If I see QEX at a hamfest and it
looks good, ditto. Otherwise I wait for the CDROM.

There's probably a moral there...

One of the companies that makes these is Nichia in Japan. Jameco
(http://www.jameco.com) distributes two different part numbers both priced
at $4.95ea. They are listed at 600mcd@20mA in either T1 or T1 3/4 sizes.

Hewlett-Packard recently announced its release of a line of white-light
LEDs (http://www.hp.com.go.led). The lamps use a blue
indium-gallium-nitrogen chip coated with a yttrium-aluminum-garnet phosphor
that produces almost pure white light. Luminous intensities of up to 2cd
are available. Pricing is qouted at $0.95 in quantities of 10000.

In this vein, Mouser advertises a "Multi-color" LED lamp with
a red, green, and two blue LEDs in one package with six leads.
It's supposed to emit different colors depending on the various
currents through the individual LEDs.
Mouser stock number 604-LF59EBGBW.

Wayne Green has been banging away at this for a long
time: the cover price of the magazine pays for the paper,
printing and distribution. Having anything to actually
print on that paper is paid for by advertising.

In its heyday (late 1970s) 73 was half advertising too.
But that was half of 200 pages...

Ham Radio was a good magazine that I subscribed to for many years. I liked it, which is why I subscribed, but I was not really overwhelmed by it.

1) It was a "good" publication that had good and interesting articles from time to time. It had its share of junk, also. Fisk was an excellent author, which helped a lot.

2) In my opinion it should not be magnified beyond that. The unbridled praise that I keep seeing and hearing is a bit much, I believe.

3) Comm Quart and QEX are just as good, in my opinion, and getting better all the time. The pejorative and belittling remarks to the contrary do not pass muster for me.

4) The comments about advertising problems seem reasonable.

I agree, there were a few really nice articles (including some of the earliest info on Gunnplexer communications that is still hard to find in one convenient place today).

> 3) Comm Quart and QEX are just as good, in my opinion, and getting
> better all the time. The pejorative and belittling remarks to the
> contrary do not pass muster for me.

That makes sense. I don't think the other poster was belitting those pubs by asking why they aren't doing better in the marketplace -- I just wasn't sure whether you were arguing fer 'em or agin' 'em! IMHO, the more info out there the better.

I've been disappointed an amazing number of times in recent years thinking that. I have NO idea how they'd make a log-periodic with a big hole in the frequency range, but I have all too often run into installations that give outstanding TV pictures, yet so little FM signal that attaching the antenna to an FM radio kills the slight pickup it was getting from its internal leads. It was only after a few of these that I noticed that makers like Winegard were selling both VHF-UHF and VHF-UHF-FM antennas. (Changing, or even eliminating, the splitter at the ground end did no good. Maybe they had a splitter up top that did the dirty deed.)

5028. INFORMATION WANTED ON CRYSTAL TO VFO CONVERSION

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-12 00:00:00 UTC
From: Robert Parker <rparker@sprint.ca>
Message-ID: <Yjq_2.7153$r_1.4067382@newscontent-02.sprint.ca>
Source record: 70415

I have an HF marconi ch150 solid state transceiver and i'm going to convert it to VFO by injecting the VFO signal into one of the crystal sockets. I was wondering if anyone has done this before and what there experience was. I realize the harmonics must be filtered before injection and therefore before I do anything, I will look at the O/P of the VFO on a spectrum analizer to determine the type of filtering required. If i'm lucky, no filtering will be required. This modification will be for both transmitting and receiving in order to give this rig more versitility. Marconi has made a very nice rig and I wish to have it on the air on nearly all the bands. Coverage of thie rig is from 2mhz-24mhz.
Second part of my query is: Does anyone know of any PC circuits that work to do the same thing as a VFO?
Perhaps a PC controlled function generator?

You comments and suggestions will be greatly appreciated.

If you look at the band allocations it is easy to figure this out.

The low VHF TV channels (2-6) run from 55 to 88 MHz, with a small gap at
around 70 to 75 MHz. Channels 7-13 run from 174 to 216 MHz, with the UHF
channels from 470 to 638 MHz.

By the way a log periodic works it would be possible to place three of them
on a single boom. One would be designed just for the low VHF channels, one
for the high VHF channels, and the third for UHF. In some cases, such as
deep fringe, this would be desirable for best TV reception as it would tend
to reject interference from any nearby FM stations.

I'm not exactly current, but if UHF covers channels 13 through 69, it
would go from 470 to 812 MHz. We do have a local channel 66, 788-794 MHz.

> By the way a log periodic works it would be possible to place three of them

My understanding of the log periodic is strictly intuitive, and I don't
have the background in math that most antenna books demand. But I suppose
if you just ripped out the 88-108 MHz elements and "slid the sections
together", it could be handled with clever feed tricks.

I do know that I've had good reception using the 136-174 MHz frequencies
and 220 MHz on a V/U/FM antenna, and always suspected they were designed
for continuous coverage from 54-812 MHz rather than as "tri-band" antennas.
Don't know for sure on that, but there don't seem to be any jumps in
element sizes in such antennas.

The technician license does NOT allow you to use ANY of the Ham bands
below 6 meters. Thus you DO have to pass a Morse Code test if you want
to be a HAM without restrictions. A technician license is like a
fishing license that only allows you to fish in a small fraction of
small lakes. Only you don't have to know Morse Code for the fishing
license with no restricions on lakes.

Well if they would replace the Morse Code with Russian and make you learn Russian with a test to keep your HF priviledges, I'm sure you would be posting some comments on how you don't understand why you need to learn Russian if you only plan to use English. And then the Hams that allready KNOW Russian would tell YOU to shut up and stop complaining and posting as they aren't looking for any good reasons not to have to learn Russian.

There are going to be a lot of posts to newsgroups that don't happen to have subject matter that is of personal interest to you. Lots of YOUR posts will not have any interest to lots of other people too.

Read the threads of the subjects you find interesting and skip over the ones you do not. Seems like a lot of wasted time to reply to threads that don't interest you.

Ham radio has changed. Packet, Satellite, R/C, television, and so much
more had nothing to do with what you said above. Perhaps all wood
workers should be required to be able to use old hand made tools of the
1800s before they are allowed to use modern power tools for the same
reason you gave.

Knowing that one has gone through, and survived, the identical
> trials and tribulations of his or her counterparts, builds a unique bond of
> dedication and purpose.

If I want to wash my clothes, I would find no bond of dedication or
purpose by using a washboard. I would prefer to use a washing machine
and dryer, and would not appreciate being forced to perform a test using
the washboard before I am given the PRIVILEDGE of being allowed to use a
washing machine. Would you? Or are you one of those lazy people that
think they should be allowed to use Washing Machines without ANY sort of
a test? How would we be able to keep CB'rs from using washing machines?

The instant gratification crowd of today has no
> appreciation for that bond.

Better sell your car and walk to work, don't use that Microwave oven either as that is for instant gratification and convienience too. Get out those two sticks, rub them together, and cook your food the hard way.

Using Morse Code was at one time an instant gratification and convienient thing too over writing and sending a letter pony express. Did people despise Morse Code back then because IT was more convienient and gave instant gratification?

All inventions give us convienience and instant gratification. That is a GOOD thing. Civilization finds better more efficient ways of doing things. Wanting to find an easier and better way of doing things is intelligent. Finding ways to make things more difficult is idiotic and stupid.

You appear to be so engrossed in your efforts to convince the rest
of the world that you are incapable of attaining anything in life that
requires effort that you seem to have totally missed the point.

The reason we have thousands of newsgroups is because the world is
filled with millions of people with different interests.

Although your inability to learn Morse code seems to be the current
focus in YOUR life, the rest of us don't necessarily view your lack
of motivation as an earthshaking event.

REC.RADIO.AMATUER.POLICY was created with the sole intent
of giving you a forum in which to air your views. Please feel free to
use it to your hearts content.

Posting your Morse code dribble in multiple newsgroups is not going
to gain you any support. Many unmotivated whiners before you have
proven this point.

Some people have things they want in life because they are willing to
expend the effort required to obtain those things, whatever that effort
may be. It is obvious to us that you are not one of those people.

What apparently is not obvious to you is that the rest of us don't care.

73, Jim KH2D

The US licence free regulations are in Code of Federal Regulations Title 47 Part 95 Subpart C. (Same part as Citizens Band, which is Part 95 Subpart D). Try http://www.access.gpo.gov and look for the link to the National Archives and Records Administration for the official online version.

For amateur radio, try and find the ARRL band plan for 6 meters.

I don't know about the 8X version, but it worked almost as well as the
mod done with the RT systems software and changing the bytes.

The biggest flaw was that it created a few memories with nothing in them
except DCS codes, i.e. no frequency showed or other things. It would not
delete those either. I note that loading said file into the RT Systems
program allowed easy deletion of the problem memories, which is one
point where the Yaesu backed software has a distinct edge. Still if you
don't have the RT systems software and want to make up your own
programming cable, I'ld consider it usable. I also note that it will load
the files that the RT systems program (ADMS-1D) creates and will use
the hardware that comes with the ADMS-1D. I had some difficulty at first
getting files saved by the program to come up in ADMS-1D, but that was
a cockpit error. It worked on my 6, and I didn't have an 8 to play with.
I saved several copies of my system the way it was setup before I
played with it, and would suggest that anyone playing with it to change
what bands it covers do the same before making changes. That way,
you can reload a working version no matter what. I suspect that the "8"
version
is just plain hardwired as is, but I'm not sure. One thing for sure is that
if it doesn't work, you aren't out any money.

Start with a narrow-band (10-15 kHz bandwidth) FM receiver. This is pretty
much identical to what is used for 2 mtr repeaters, police, fire, etc.

I wasn't, but that didn't seem to matter. Not when there
are uppity bitches to put down...

There is no denying that _ham radio_ was by far the most
techie engineering-oriented ham magazine. It was good, if
that's your schtick (it *is* my schtick). But the
reverence it attracts these days seems all out of
proportion, and seems to have a large nostalgia
component.

Do people want a real techie ham magazine (QEX/CommQuart -
both imperfect, but both on the right track), or do they
want nostalgia?

Alex,

Interesting idea, however I doubt a desktop PC has the computing horsepower to keep up with anything above audio frequency. Most of the DAC/ADC cards I have seen only support conversion rates up to the low 10's of Khz, which again limits you to audio frequency work. The fastest cards (conversion rates around 100 to 500 Khz) I have seen use a buffered type of design and are very expensive.

If your needs are only in the audio range then check out Texas Instruments, Motorola, Bur Brown etc. for info on their DSP evaluation boards. These boards are normally complete systems with analog I/O, memory and a fast DSP chip. Some of these boards can be had with a floating point DSP chip for under $200 USD. You would most likely spend just as much for a PC DAC/ADC card alone. In addition these evaluation boards come with manuals, programming software (assembler and linker), and a RS232 port so you can use your PC to develop/write the software on for down load to the board.

I have 6 4CX-250 tubes and all their accessories and was wondering if I could build a legal limit linear with 4 of those tubes. What would the load impedance be in this case? Would it be too low for a simple pi filter? Are there any schematics available for such a set up. Any help and advice is greatly appreciated.

Here at work we are currently using a 450 MHz pentium running NT for
developement work. This is in a VXI chassis which is designed for such
things, unlike a PC. We also have a 20 bit 20 MHz A/D with internal DSP
(for filtering and I/Q conversion) for collecting the data.

Even with all of this we can't do real time processing, of course we are
doing some pretty hairy stuff!!! (I programmed the DSP routines, by the
way.)

>If your needs are only in the audio range then check out Texas Instruments,

We are looking at using a DSP VXI board, but some of us doubt that it would
be any faster than doing it in the main processor with software, and
probably would be slower (clock rates are slower and you still have to
shovel the data back and forth). Of course we are digitizing a 5 MHz
signal, so audio on a DSP may be ok.

Have you looked into using the good ol' soundblaster card?

Sir writes:

> What about it? Code test required.

Yup! I'm a + and will soon be a General<g>. CW is really addictive and it's amazing what you notice once you learrn it. Just the other day I was watching a AAMCO Transmission commercial on TV the other day. Their motto is "Double A, beep beep, M, C, O", it subconciously dawned on me that the "beep beep" is Morse for the M <g>. It's also nice to finally be able to know what the repeaters say when they ID.... it's not always just the callsign :) Anyways, CW may not be for eveybody, I guess that's why we have different license classes. There is a place for all of us in ths hobby!

Source record: 70302

roncook@worldnet.att.net (Ron Cook) writes:

>"Almost pure white light" ??

>By definition, is not "white" light an equal mixture of all possible
>visible wavelengths ?

An equal-power mixture of all wavelengths would be "white noise" at
light frequencies. It would also be one sort of "white" in colour.

Light from the sun is often regarded as "white", but it does not have
equal energy at all wavelengths. It *does* have all wavelengths present.

However, "white" usually means "anything that a human perceives as white".
You can produce the sensation of white using three single-frequency
lasers with the correct ratio of intensities.

You can get white by mixing red, green, and blue LED output as well.

Apparently, the "white" LEDs don't do this - they're really blue LEDs
combined with phosphors to convert most of the short-wavelength blue
to longer wavelengths.

This is the same as most "white" neon tubes - the arc is blue or UV,
and phosphors on the inside of the tube convert it to something approximating
white.

Dave

>And, what is the color temperature ?

Good question. For the tri-colour LED, it should be adjustable over a
wide range by adjusting R G B drive currents. The "white" LED is
probably fixed in colour temperature.

Dave

In fact, Sir, any woodworker who seeks meaningful certification, as by attending a reknowned school, such as Boston's North Bennet Street School, starts out on hand tools before he can touch power tools. This is an apprenticeship strategy that makes sense for many fields, including amateur radio. CW is very effective communication, and a real pleasure to operate. I am a long time CW op who realizes that we shall have to allow the No-Coders access to some HF privileges to stop their whining, and acknowledge the political reality of the situation. I passed my General code test at age 15 -- it is not hard, but does require some application and the deferment of gratification.

5072. New Version of Flexi-Tuner for the RX-320

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-14 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <37763517.5415541@nntp.ix.netcom.com>
Source record: 70309

May 14, 1999

Hello All,

The beta versions of Flexi-Tuner for the RX-320 are finally done and over with! Many thanks to the testers for their feedback and suggestions. All comments were very helpful.

Version 2.0 of Flexi-Tuner for the Ten-Tec RX-320 is now available for ordering.

Priced at $20.00, version 2.0 is an inexpensive way to take advantage of the features on the RX-320 that Ten-Tec did not implement and, at the same time, to have a control program for both DOS and Windows.

The major features of Version 2.0 of Flexi-Tuner for the Ten-Tec RX-320 are as follows:

1. Operates the RX-320 from virtually any desktop or laptop computer, including older 386 machines. An excellent use for that old 386 machine in the closet or one of the many $100 older laptops available at pawn shops and used computer stores.
2. Works in either DOS or Windows (this is a DOS program with a DOS interface).
3. Implements 34 selectivity filters from 8Khz to 300Hz.
4. All modes: AM, USB, LSB, CW.
5. AGC implemented: Fast, Medium, Slow.
6. Tuning steps down go 1 Hz or up to 1 Mhz, including 9Khz and 3Khz.
7. Adjustable squelch.
8. Bandpass tuning for CW and SSB (offset from center freq.)
9. Scanning using scan files. Adjustable parameters.
New! You can now have up to 200 scan files with as many 100 entries in each.
10. Built-in scan file editor.
New! You can now tune to any entry while in the scan file editor.
11. Built-in logging function with log editor. Easily track, edit, sort, monitor, and export log entries. Items logged include station name (or notation), frequency, mode, filter, date, time, and S-meter reading. Time and date can be adjusted if you want to log in UTC or other time zone.
New! Sort by time added to the log editor.
12. More sensitive S-meter.

13. Pause S-meter function on front panel. This eliminates
the "chuffing" heard on some RX-320 systems.
New! 14. Instantly mute audio with a single key.
15. Almost all parameters adjustable (great for knob twiddlers
like me).
16. Tighter code for faster operation.
17. No mouse required (or supported).
New! 18. Supports color, B&W, and inverted B&W monitors (CGA or
better, including B&W VGA monitors).

The program is supplied along with several scan files in a single zip
file. It can be sent to you either by e-mail or regular mail on floppy
disk. Installation and removal are simple, as the program does not
affect any system settings. Operation is also straightforward -- just
press various keys as shown on the screen.

Installation, removal, and operating instructions are included.

I would be pleased to send you Version 2.0 of Flexi-Tuner for the
RX-320.

Regards and 73,

David
W7HTJ

P.S. A demo version is available at no charge. It has all the features
of Version 2.0 except that the number of scan files is limited 25, each
scan file can hold 25 records, and the log file is limited to 250 en-
tries. An RX-320 is needed in order for the demo to function.

RX-320 Flexi-Tuner V. 2.0

How To Order

The full program, Flexi-Tuner Version 2.0, is available for purchase.
Shipment can be made by e-mail or on diskette by regular mail.

Price: $20.00 US for shipment by e-mail.
$25.00 US on diskette shipped by regular mail.

Send payment (check or money order) in favor of David C. Andresen.

Address: 8103 104th St., S.W.
Tacoma, WA 98498

Tel. (253) 588-4149
Fax: (253) 588-4366
E-mail: mktg@ix.netcom.com

All shipments made within 24 hours of receipt of payment.

Please include your e-mail or mailing address with your order.

Name: _____
Address: _____

haven't seen your circuit, but believe they applied the Zwischen-basis RF amplifier with oscillator/mixer in one section. I have much info about the mixer design, but in German language. (Handbuch f&#65533;r Hochfrequenz und Elektrotechniker 1952-1955-1957... 4 volums. The zwischenbasis amplifier is described with centertapped coil - equal halfs for grid and cathode, it has the advantage of simultaneously maximum gain and minimum noise figure, this is not possible with conventional RF- amplifiers. But most of the designs used have not centertapped coil, and very little abstracts is found describing what was improved over the basic design. Believe ECC85 was the most commonly used valve for such FM tuners, while ECC84 was used earlier as cascode amplifiers.

Maybe not...he's looking for some 4-inch ferrites.

Could be it's for a 27 millihertz oscillator.

5079. IF-10A CAT adapter for KENWOODS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-14 00:00:00 UTC
From: ernie@netvision.net.il
Message-ID: <373c8c27.32489782@news.netvision.net.il>
Source record: 70316

Hello ALL,

The IF-10(x) unit will allow for control of Kenwoods via the RS-232 port of the computer , or direct TTL in case of track-box use.

I have built a clone of it for KENWOOD TS-711 , TS-811 TS-940, 140 & 680. The unit is instaled exactly as the original one, meassures the original size, and is built on a double-sided PCB.

\Depending on the amount of user-demand for the unit, I can have a kit made; The project will be a non profitable one, (Donation to Amsat) and price ($ 55 more or less) will depend on the amount of units.

This is a survey in order to now what to expect.

Please reply to me (4Z4TL) here (ernie@netvision.net.il) or v satellite to 4X1AS, Shlomo.

73 , Isaac Lindenbaum, 4Z4TL, Phone\Fax: 972-9-9588161

Credits: The printed circuit was edited by basil ZL3UF, and the schema modified a bit to suite implementing a crystal by Yakov 4Z5AY.

hello JMN,

So the first rf coil was centre tapped.

can you give some coil winding details
of the the oscilator coil as well from that
german book .
That will be most helpful.

Clearing out the last of these frequency reference, unused precision SC
cut oven controlled crystal oscillators at 16.384 MHz that divide down
to 1,2,4kHz etc., they approach
small rubidium in long term stability and do better in
short term stability.
This is the only frequncy I have, as Im an oscillator designer I
recognised these oscillators when they came on the market from a
cancelled cellular phone system in the UK, special price now 5% list
price ie UK pounds 25 $US 45 (approximately 5% of the
list price).
Email for circuit to lock to any other freq around 10MHZ in 1kHz
steps and fuller spec.

I'm thinking about designing a simple HF transmitter for use exclusively on the digital modes. (I'm not interested in voice or CW). Has anyone here given any thought to this? For example, would it be better to modulate the rf directly or use a SSB type upconversion for those people using soundblaster cards and digital software? I have some of my own thoughts the requirements of such a radio, but am interested in the thoughts of those of you with more experience.

Sorry, the only connection of this to amateur radio is that my vehicle contains my mobile ham rig. <grin>

I'm looking for automotive surplus strips of very bright LEDs, like you see in the newer vehicle spoilers' 3rd brake lights. I'd like to make a 3rd brake light that really is visible in my old '80 Volvo rear window.

They're too expensive new. I don't like the look of the lamp bulb and jeweled lens cheapy, after-market 3rd brake lights.

This list will prove beneficial to anyone who is interested in the collection, restoration, and operation of vintage radio equipment. While this list will deal mainly with American-made amateur radio receivers and transmitters, other makes are welcome so long as they fit the category of "vintage". To
qualify for vintage status a set must be 25 years old and preferably contain some vacuum tubes. This category can include military, home broadcast sets, commercial equipment and homebrew equipment. Any homebrew equipment using vacuum tubes and operating CW or AM will be considered "vintage" equipment no matter what the age. Accessories such as keys, antenna tuners, wattmeters, test equipment, etc. is also considered a part of the Vintage hobby and will be welcome if it is at least 25 years old.

I sincerely hope that you will join our group of vintage enthusiasts. With your help we can make this a great List.

Please do NOT subscribe using a forwarding e-mail account (e.g. qsl.net; arrl.net). Please use your actual, non-forwarding address only.

To subscribe, visit http://www.qth.net and select vintage-radio or send e-mail as follows:

5093. Re: Linear with 4CX-250s

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-15 00:00:00 UTC
From: Heinz Schnait <oe5eep@qsl.net>
Message-ID: <373DB1CB.2E939381@qsl.net>
Source record: 70186

There was an article about a 4x 4CX-250/B linear amplifier in an Austrian Amateur Radio Journal. The author got 1.6kW with 105W drive and

450W with 10W drive. The plate voltage was 2kV. He used a simple PI Filter with 150pF(Tune), a roller inductor (25 turns, from hamfest, no further data given) and 1500pF(Load). I guess that's for 80 - 10 meters.

Certainly need higher values on 160. I thought about duplicating this design but never got started, too busy with other projects! Hi

The author is an oldtimer. He has built eleven linears before but this one is his first with ceramic tetrodes. The author does not have e-mail access. The article is written in German but the schematics might be usefull to you. Let me know if I shall send copies. (provide your fax number).

Stereo-Doppler Microwave Intrusion Detector.

This unit was manufactured by Protection Technologies in late '94. It is brand new unopened in the box (I am currently using the one in the photo). The unit uses microwave RF energy at 10.525 GHz to flood an area 80x80' (adjustable down to 8x8'), and detect intruders moving at rates between 3 inches/sec and 10 miles/hour. The unique 2-channel Stereo Doppler signal processing allows the unit to discriminate between annoying false alarms generated by rythmic or cyclic motions caused by ceiling fans or wind vibration, etc. The unit model number is SD-80 and is complete with mounting L-bracket with hardware, and operator/schematic manual. This is a professional unit, not a Radio Shack alarm toy. Original cost was $425. Dimensions are approx 4x6x8" in a rugged, attractive case. Requires 10-14 VDC at about 3 watts and operates simple relay contact closure systems. The manual is very detailed and discusses how to incorporate this unit with standard and custom alarm system. I am only auctioning one of these now, but if demand is high, I have 3 more and can sell additional units to a willing buyer to build an entire system. See the picture at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=102107090

only 1 day left and the current price is $50, thanks.

5098. find Trimmer caps and ferrites

Hi all and thanks for reading this.

The May newsletter for the Southside Amateur Radio Society Inc is now available for download at http://www.qsl.net/vk4wss

Articles in this issue include: -

Feature Article - Your First H.F. Transceiver
Golden Antenna Award
Trivia - Why Radio Amateurs Are Called "Hams"
The Double Windom
Funnies
CB to Six - Part 3 of a 4 Part Series
Travel Host Scheme
Club News
Odds and Sods
Schematics - A simple Power Supply

Back issues are available.

Other items include on line AOCP and NAOCP exams, a linear amplifier project, CW tips, Callbooks, Software and more. Why not drop by and have a look?

5104. Linking Repeaters via the Internet

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-16 00:00:00 UTC
From: gbrent@garlic.com
Message-ID: <373e18e5.8858355@news.garlic.com>
Source record: 70192

I'm thinking about creating a board so I can link my repeater to any other repeater using NetMeeting or some other internet voice software. Used to link repeaters via UHF links. Now, with the internet, we can have a full time link to repeaters anyplace in the world and at the same time avoid propagation problems and interference. This would be great fun to at least try.

Has anybody tried this yet? Looks like it would relatively simple. You've got audio and mic connections at the sound board on the computer. Connect to transceiver via cable. Little circuit to detect audio voltage and key transmitter.

Would be interested to know the results of anybody who has tried this.

73's,

Gerry

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Try JC Whitney as well. I bought an LED unit from them for my old Honda. The unit is in a small black case that adheres to the rear window. It is actually smaller and less obtrusive than the OEM unit in my other Honda.

1999 May 16 (Sunday) 10:10 PDT

Satellite Launch Monday Night

Weather permitting, a missile launch scheduled for Monday, May 17th should be visible across most of California and as far away as Reno, Nevada; Saint George, Utah; and Tucson, Arizona.

Orbital Sciences Corp. will launch a Pegasus XL missile from an L-1011 flying off of California's central coast. Following release, the Pegasus should head due south and gradually climb. Several minutes later, the TERRIERS satellite should be placed into a polar orbit.

The launch is scheduled for 22:10 PDT, but can occur at any time during the 22:05-22:15 PDT launch window.

Observers near the California coast should see what appears to be an orange light moving from north to south.

Countdown status can be obtained beginning at T-1 hour by calling the 30th Space Wing Public Affairs office at 805-606-3595. The office should be manned Monday night from 21:15 to 22:45 PDT. More detailed countdown status will be available from the Vandenberg Launch Nets (see below).

Vandenberg Launch Nets

If the weather is clear in Santa Barbara or Ventura County on Monday night, ham radio operators in southern California are planning on running two nets to pass along countdown status and discuss the launch.

The primary Vandenberg Launch Net will be convened on the 147.000 MHz Santa Barbara repeater (131.8 Hz PL, +600 KHz offset) beginning at 21:30 PDT. Net Control will be Brian, KD6NRP.

The backup repeater will be the 147.885 MHz Thousand Oaks machine (127.3 Hz PL, -600 KHz offset).

A parallel HF (shortwave) Vandenberg Launch Net will be held on 3,815.5 KHz (LSB) beginning at 21:30 PDT. Net Control will be Dan, AC6NZ.

Pegasus XL/TERRIERS Launch Data

Launch Azimuth

The launch azimuth will be 190.52 degrees from true north. The vehicle will fly a north to south path.

Notes

1. Latitude, longitude, and altitude data was not available for all events.
2. The time, latitude, longitude, and altitude data for the other mission events was provided by Orbital Scienes Corporation.

The following is a NASA news release
regarding the TERRIERS mission.

STUDENT-BUILT SATELLITE SCHEDULED TO LAUNCH MAY 18

The TERRIERS satellite, built by students at Boston University and scheduled for launch on May 18, could provide a much better understanding of how changes in the ionosphere -- the electrically charged region of the upper atmosphere -- affect global communication systems, satellites, cell phones and pagers.

The Tomographic Experiment using Radiative Recombinative Ionospheric Extreme ultraviolet and Radio Sources, TERRIERS, named for the University's mascot, the Boston Terrier, will launch from Vandenberg Air Force Base, CA, at 1:10 a.m. EDT on May 18.

TERRIERS will use a unique combination of space- and ground-based instruments to measure ultraviolet, radio and visible light, which are produced naturally through various chemical reactions.

TERRIERS will use this light to create high-resolution, 3-D images of the ionosphere, similar to the way a CATscan takes multiple X-rays of the human body to assemble a three-dimensional image.

Just as high-speed electrons slamming into a TV screen cause it to glow and generate a picture, when high-speed charged particles smack into the Earth's ionosphere, they cause ultraviolet light to be emitted in the form of auroras. TERRIERS will measure these emissions to better understand the upper atmosphere.

"There is an increasing need to understand the ionosphere because changing conditions in this region adversely affect transmissions from communications satellites and impact global positioning systems," said Boston University's Daniel Cotton, principal investigator for TERRIERS. Data obtained from TERRIERS also could help scientists better predict space weather, Cotton said.

NASA's cost for the spacecraft is an estimated $6.1 million, which combined with the cost of the launch vehicle totals an estimated $12.3 million.

A three-stage Pegasus rocket, manufactured by Orbital Sciences Corp., Dulles, VA, will hold the 272-pound (123-kilogram) satellite under the belly of an L-1011 Stargazer aircraft. The aircraft will release the Pegasus rocket at an altitude of 40,000 feet over the Pacific Ocean. The Pegasus will carry the TERRIERS satellite into its 340-mile (550-kilometer) orbit. The spacecraft will then circle Earth in a polar orbit once every 96 minutes.

More than 60 Boston University students and faculty members have been involved in the science, theory, design, instrument-development and testing of TERRIERS since its selection in 1995. Sixteen Boston University undergraduate students will control the satellite from a mission control center located on campus after the satellite reaches its final orbit.

In addition to scientists from Boston University's Center for Space Physics, other collaborators on the mission include teams from the Naval Research Laboratory, Washington, DC; University of Illinois Urbana-Champaign; Massachusetts Institute of Technology's Haystack Observatory, Tyngsboro, MA; and AeroAstro, Herndon, VA.

TERRIERS is one of three NASA-funded missions under the Student Explorer Demonstration Initiative (STEDI). The Universities Space Research Association of Columbia, MD, administers the STEDI program for NASA. Information about STEDI can be found on the Internet at:

http://cass.jsc.nasa.gov/stedi/overview.html

For more information about the TERRIERS project, visit the Boston University web site at:

http://www.bu.edu/satellite

5113. Constructing Helical Antenna ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-16 00:00:00 UTC
From: Terry Gaff <shbcommm@indigo.ie>
Message-ID: <373F2ABE.D9BB1C5A@indigo.ie>
Source record: 70201

Hi all,

I have built two helical antennae to replace my 1 meter dish (I can't put this one on the roof !) but despite a lot of effort I have failed to get any signal out of them. I have two PC programs (and my own math) for calculating helical antenna dimensions, they both say that the ground plane or reflector should be BETWEEN XX cm and YY cm diameter (circular reflector), are these dimensions critical i.e.. can it be larger than the specified dimension? How critical is matching, when I feed in frequency and amount of turns required etc. both programs tell me that the impedance is 140 ohms. Don't I have to match it to 50 ohms? I have seen various helical designs on the web, one type has the helix material flattened at the reflector end and another type incorporates a type of matching strip 1/2 a wavelength long with the helix soldered somewhere along its length. Which method should I use? Or is there any thing else that's is important I should consider?

I would appreciate if anybody could help me with this.

Regards to all.

Terry Gaff

5114. Need Help With Overdrive Protection

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-16 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <7hnf1c$lf1$1@news2.bit-net.com>
Source record: 70202
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I am well along the path to building my 1KW 160-6m
solid state amp. I want to defend the finals (a pair of
MRF154's) with an input circuit to limit potential overdrive.

I see two options:

1. Use a 100W (4dB) pad which I understand will divide
whatever the input power is by 4 and send 3/4 of it into a
dummy load and 1/4 to the amp. That way with 100 watts
of drive the amp. only sees about 25 watts.

25 watts should give full power. Pieter N4IP who has built
one of these (see: http://www.ibelings.com/n4ip/sskw/) says
he has accidently keyed 100W into his amp on multiple
occasions and nothing blew up. He says the MRF154/157
transistors are very rugged.

2. A peak power detector that feeds a voltage to a circuit
that trips the COR if the 25 watt drive threshold is exceeded.

Option 2 is better because I can run the drive rig at lower
output thus extending the life of that rig. Option 1 is simpler ...

I am seeking your advice and your favorite circuit(s) to
accomplish either or both.

Thanks! & 73, DavidC K1YP@qsl.net

5115. Headset to handset conversion question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-16 00:00:00 UTC
From: Richard &/or Patti Herndon <herndonNONONOSPAM@texas.net>
Message-ID: <373F47A5.856@texas.net>
Source record: 70203

This is a combination communications and ham radio related question.

I noticed in the new Radio Shack flyer on page 3, there are three new models of phone headset that all use a stereo 2.5 mm plug. They seem designed for cell phone use, but seems like they could also be used in ham gear and a regular desk telephone set if a converter box is built.

MY top priority: Has anyone any experience in converting this (actually any one of the three) units to plug into a regular desk phone?

MY secondary priority: Same question for ICOM or similar ham gear? Did you have to do anything special to get the voltage they probably use for the mic?

Does anyone know if they are condenser mic or what? i.e., what voltage do they need? do they have built in amps or other special requirements that would limit their use for ham 4-8 ohm audio out?

Thanks. I can do all this, just other fish to fry if someone else has already swum this channel. <grin>

Thanks for info and please note to remove the all-caps part of my email address for direct replies.

> the time to learn morse code, only to forget it once one has the license
> to go ahead and use voice.
>
> Only people who intend to USE morse code should learn it.

90% of the automobile drivers out there don't intend to use anything
they *learned* to get their drivers license, why not drop that
requirement too? Just let 'em all drive, drop the roadtest
requirement!

>That's ok we can argue all we want about keeping the code test, but something
>needs to be done to bring people into amateur radio not keep them out.

Ever stop to think that maybe the government intended to keep some
people out? Why not drop the code requirment for commercial broadcast
while we're at it?

>I suspect the same small fraction of 13 year olds are still learning code. Like many
>things that require a little work up front, CW is worth it.
>73

And worth some pride too... ever heard of the rite of passage. Why
not do *something* you can take pride in instead of changing the rules
so you don't have to apply hardly any effort?

> If you're not wired for it, there are many other modes to use. That is one of the
> beauties of ham radio.

Absolutly!!! The whole spectrum above 50 mhz is wide open for those
who have no interest in CW. You knew it before you got into radio...
So what's the problem? (but be forwarned... you'll hear alot of CW
there too. Moonbounce, contesting, etc.)

>The key to keeping code from dying is those of you who are proficient MUST take
>those of us willing to learn under your wing and pass it on to us....

Seems all the *old Timers* around here left me to my own devices...
Wonder *how* I did it..... hmmmmm

>If you efforts to find someone in Ft. Worth fail, Why dont you and your
>buddies get on the 2 meter radio and teach each other?

5 wpm is NO CODE. It's like an open book test. If you *try* to learn
the code with *any* effort at all, you *will* pass the 5 WPM test.
From there you'll meet hundreds of others in the same boat on 40 & 80
mtrs.
Plenty of practice to hone your skills. I had a problem getting over

10 wpm myself once licensed as a P, but got on the air with a friend
of mine for an hour a nite over the period of a week, pushing
ourselves to the limit, and passed General that weekend. *USE IT* once
you get it.

> I have the skill to pass the practical test (and have with the training software) through
> Advanced, yet I hold only a Tech ticket because of the code. I am still trying but I
> haven't found my method for learning code yet. I memorized the tapes, and have tried a
> couple of different computer tutor programs, but so far I have not been able to master
CW.
> I will get it eventually, but it is not coming easy.

Sounds about normal to me...
if you study... it will come......

>If your son doesn't have to learn or like radio to enjoy Morse Code,
>then people who want to use or like radio do not have to learn Morse
>Code.

Did you're mama ever say "who ever said life was fair?" Just 'cause
you want to learn gun handling doesn't mean you have to kill someone.
I don't have a son, but I have to pay school tax.... WHAAAAA!

Hope I hit a few sore neves here. Amateur radio isn't the only thing
in life that will require you to learn something proficiently to do
(unlike my spelling to post to the group).

Take a look back at all the things that got lax on the rules in the
past and see what happened to them. Do you really want amateur radio
to go that route?

The hardest part about learning the code is to just put away all
the excuses you have as to why you < can't / don't have time for /
shouldn't have to / are just to darn lazy to > learn the code *and do
it.*

Next thing you know, after they start packaging up an extra class
radio amateur operators license in all the HF radios (sound familiar?)
They'll be whining that the FCC should abolish CW off the airwaves
'cause they can't handle not being able to understand what is going on
on the bottom half of the band.

I might could stomach letting a small portion of the prime DX bands go for the slow coders (P's),and leave the rest of the licese structure alone. But I hope at least that they leave the extra class alone so that *some* of us can keep a little pride in something that we *worked for* instead of crying about it 'till we got it for next to nothing.

If anyone out there is interested in *learning* CW and going to EXTRA in 6 months, e-mail me. All it requires is about 4 hours a week of *dedication*... You have to *want to do it* to do it.

The others.... FLAME AWAY, got my asbestos boxers on.

Breaker Breaker x.19x.xxx.xxx, catch me on the bottom 150 khz of the band good buddy, c'mon back!

having built an amplifier using a pair of 4cx300a's, a next door cousin to the 250, as far as I can remember, the only real difference in the tubes are there plate dissapation, the 250 for two hundred fifty watts, the 300 accordingly. as for using four of them, kinda think you will have problems, with a match. two will run a kw fine..... The Radio Handbook by William I. Orr, W6SAI first printed in 1970 has the schematic of the rig I built several years ago (I have the eighteenth edition of the handbook) says it is listed in library of congress catalog card number 40 33904, I know ur looking for a four tube design, this is only using two of em, and u gotta force air thru them for cooling, as you can tell with the plumbing hi hi gud luck

Source record: 70208

I have an old broadband RF power amp that I made into a linear amp. It produced a 300 watt AM carrier and 1200W peak on AM (staying within ratings), but in SSB it put out about 1800 watts PEP.
There is a neat little set of calculation programs for figuring pi and pi-L networks, and other linear-related things, free to download at:

http://www.montagar.com/~patj/rf_read.zip

I wrote them years ago, and the PIOUT.EXE one certainly saves alot of time getting the output section to work right the first time.. Hope you like simple DOS programs.

Give me an example, I can't think of one thing you learn to get a
driver's license that you wouldn't need to know when you drive.

why not drop that
> requirement too? Just let 'em all drive, drop the roadtest
> requirement!

That would be like dropping the rules and technical requirements on the
ham test. Both are needed and used by everyone in Ham radio. We are
talking about Morse Code which does NOT have to be used in order to
operate Ham radio. If it was required to learn how to ride a horse to
get that driver's license, then you could argue about that, but they
don't test for stuff EVERY driver won't need to know in order to drive.

> Ever stop to think that maybe the government intended to keep some
> people out?

No, they droped the code on the tech to get people in, not out. They
would drop the code for other classes too if they could, but it is an
international requirement, so it will take a bit longer to do.

Why not drop the code requirment for commercial broadcast
> while we're at it?
```

There never was or is a code requirement for commercial broadcast.

How about a variation on Option 2 to provide an ALC feedback to the rig to keep the power down to 25w? Commercial amps have been using it for years. It's faster than the COR and a lot less trouble to design. All you would need is a little alc amp calibrated to send a signal back to the rig.

I'm interested in how some of you measure Q of high Q inductors.
I thought I was isolating the scope probe from the coil with a 1 meg
resistor, however I tried a suggestion from Roy Lewallen and used
a 1pf cap and the Q went up considerably.
So I'm asking for your best methods to measure Qs of over 500.
I'm willing to build a test setup just for measuring Q.
I'll use parallel or series tuning.

Thanks
Mike

In article <3739b6b4.0@news.netwalk.com>, "Jim" <jbolinger@Nloisnptaemk.com>
writes:

>How much do they list a 3 volt incandescent flashlight bulb for?
>

Even at $3.99 plus let's say some resistors to limit voltage across the
LED, the LED could be cheaper to use in several different ways. First,
if treated properly, the lifespan of an LED is at the least hundreds of times
that of a single bulb, thus one LED in terms of lifespan is equal to
several hundred bulbs. I also note that if ones needs are for a light for
an extensive period of time, 20 mA drawn from a set of D cells or C cells
is quite likely to use less in the way of battery power and give extended
battery
life too.

The downsides are that you can't use an LED to warm your hands in cold
weather as you can do with an ordinary flashlight bulb, and the light output
expressed in some ratio of light candles is tremendously less. That being
said, LEDs with a properly shaped reflector might be a good idea for many
in need of the services of a flashlight.

The problem with all "option 2" circuits - including ALC feedback - is that they have a finite response time, which is almost certainly longer than it takes to blow the MOSFET gate.

The same applies in the transceiver that is driving the amp: all modern transceivers are capable of significantly more than their rated output power, and are held back by an internal ALC loop to improve the linearity. At the beginning of a transmission (or after a pause) there may be a spike of output power that would be enough to blow a following MOSFET. Transceivers vary, but some are particularly likely to do this if the power is turned down using the front-panel control, which actually operates on the internal ALC loop.

Therefore the best idea seems to be a combination of "option 1" and "option 2". Use enough fixed attenuation to protect the MOSFETs against physical damage at all possible power levels (up to at least 150W for a 100W-class transceivers, regardless of the front-panel power setting), and also use ALC to protect against non-linearity.

5131. Re: Constructing Helical Antenna ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-17 00:00:00 UTC
From: jstrohm@texas.net
Message-ID: <7hpduh$js8$1@nnrp1.deja.com>
Source record: 70217

Hi Terry

The stuff you've found pretty much describes the state of the art for helicals for amateur use, as of the last time I played with them, which was 1992.

My experiments (without benefit of sophisticated test gear) showed that the center-fed helical was at about 150 ohms, and the side-fed with flattened section was about 75 ohms for my stuff, which at 432 MHz wasn't rigid enough to get solidly to 50 ohms. I used a 75 ohm feed and ran everything on 75 ohms, and had usable results.

Think it's just an impedance match problem? Since you're replacing a 1-meter dish with a helical, you're at a high enough frequency that even a minute spacing or alignment variance will affect impedance profoundly.

Can you build your matching section as a microstripline on teflon board or on glass-epoxy with known characteristics? This might make things more controllable. Yes, I realize that since you have a .ie domain, you may have problems getting teflon PCB.

5132. Contest and voice keyer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-17 00:00:00 UTC
From: Stu Olson <solson@usa.net>
Message-ID: <7hpa50$s7v$1@fir.prod.itd.earthlink.net>
Source record: 70218

With Fieldday and the June VHF contests just around the corner, why not save the old "voice box" and use a software digital voice keyer. "VoiceKeyExpress" works great on your lap top or full sized PC. Version 1.3.5 is available for downloading at the URL below. Runs as a standalone application, or is fully integrated with the FT-Manager radio control software. Don't wait till the last minute to register, as I'll be on vacation during both of the contests.

5133. Oscillator problem with HB tube xmtr

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-17 00:00:00 UTC
From: cartercook@aol.com
Message-ID: <19990517114359.12426.00001606@ng30.aol.com>
Source record: 70219

I need some ideas from you who know tube transmitters.

I have built a 6DQ5 transmitter from the 1962 ARRL Handbook and am having difficulty with the 6AG7 oscillator section. The lower half of the 6AG7 acts as a xtal oscillator. Top half of the tube is connected to a tuned circuit and is supposed to amplify the signal for the output tube grid.

The lower section of the 6AG7 works great. I can hear it fine on an adjacent receiver. However, I can't get the 6AG7 to induce the necessary 2 mils of current onto the grid of the final.

I've checked the wiring and verified with a grid dipper that the 6AG7 tuned circuit is resonant. I have rechecked associated components for value, opens and shorts.

What's my next troubleshooting steps? Any suggestions will be gratefully received.

5134. PC boards from Inkjet

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-17 00:00:00 UTC
From: VINCENT COPPOLA <vinyc@snet.net>
Message-ID: <374036BD.FE9@snet.net>
Source record: 70220

I have an Hp 694C Inkjet. This following FAQ talks about plotting the board to tracing paper and then exposing the board using the standard positive pre-sensitized method.

Has anyone had any experience with this? Results versus a laser?

I am also thinking instead of tracing paper maybe trying the InkJet transparencies, although they are more costly. That might reduce exposure time.

This site says much about the various processes.

Hi, here ya go...
CK-526AX, comon hearing-aid (Huh?<Grin>)
type, 1.25 volt filiment, 4 milliwatt output.

1AG5, T2X3 sub-mini diode/pentode
filiment 1.25 volts, @ 40 mA,

You may find out more by using this online
tube database,where it says 6AK5, just wipe that and enter tube # you are
interested in. It is at the below address:

http://hereford.ampr.org/cgi-bin/tube

Glad I could help...
Regareds, Joe Pratt, Tubecntral@aol.com

5137. FS: Ceramic Filters and stuff

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-17 00:00:00 UTC
From: bw201@torfree.net
Message-ID: <FBw1y6.G4K.0.queen@torfree.net>
Source record: 70223
Cross-posted to: rec.radio.swap,sci.electronics.components,rec.radio.amateur.homebrew

Here is an updated list as of May 13 as some items were sold.

The following are personal items I have for sale. Best reasonable
offers accepted, but I reserve the right to deem what is reasonable ;-)

I will not consider offers totalling under $20 (before shipping) due
to the amount of bother in breaking up all of this into very tiny orders,
but will break this up into smaller orders, so you may bid for all or
some of the quantity of a particular item and mix and match as you wish.
Final discretion is completely up to me, and I will not even respond to
absurd bids (such as the guy who wanted all 72 triacs for $10 Canadian
including shipping when the shipping would have been about $6!) The
minimum reserve bids are primarily for the cheapest priced items to keep
away the people who think I will sell the whole lot for almost nothing,
but also for the rest of you so you know I am not completely heartless.

I will have other stuff to add to this list over time as I go through
my drawers and a couple of boxes. I hope this will go well and that
I won't have to resort to E-Bay at some time in the future. So I will
post the updated list as items are sold. But I don't expect it to
sell quickly because of the nature of the items. I have to see if
this will work well or if it will be total anarchy.

E-mail your offers to bw201@torfree.net

Shipping is extra, but I can confirm shipping from Toronto, Canada and
can work it into the price if you wish. You may make bids in either
Canadian money or U.S. dollars. Orders must be prepaid but I can send
you references of people I have dealt with on sci.electronics.* groups
all of whom were happy with our dealings. And once an offer is accepted
we will trade physical addresses and phone numbers.

I have done all of my shipping by surface or air, parcel post, insured
by the post office so far with no problems.

Thanks

Qty. Item MINIMUM reserved bid
All items have never been for the TOTAL
been used unless noted quantity of this
(ie. it says "USED") particular item in
U.S. dollars,

VVVVV

100 SFE10.7MA5A Murata-Erie 10.7MHz ceramic IF filter $ 10
(red dot - 10.70MHz center frequency) 3dB bandwidth
280 ±50 kHz, 20dB bandwidth of 650kHz, 6dB insertion
loss, 330 Ohm input/output impedance, the standard
for most stereo's and home receivers

25 KBF-455R-15A Kyocera 455kHz ceramic 6-POLE IF filter 44
455kHz ±1.5kHz center frequency. 6dB bandwidth
±7.5kHz (ie. 15kHz), 50dB bandwidth of ±15kHz.
6dB maximum insertion loss, 1.5kOhm impedance.
0.28" X 0.433" X 0.34" high. 5 pin type (one input
one output, and 3 ground pins and I can provide
copies of the data and pin-outs from their catalog)

25 CFW455E Murata-Erie 455kHz ceramic 6-POLE IF filter 36
6dB bandwidth ±7.5kHz, 50dB bandwidth ±15kHz
6dB maximum insertion loss, 1.5kOhm impedance.
These are very similar to the Kyocera ones and I
again can provide the data and pin-outs. Remember
these are the equivalent of THREE of the regular
2-pole filters.

1200 Ferrite beads - About 0.1" long x 0.13" O.D.,

84 Taiyo Yuden 3 lead passive hybrid filters 1.00
pn BPF07225, believed to be 72.25MHz bandpass
filters for commercial band receivers.

3 Raytheon 726C/JAN Kylstrons used and in unknown
conditions but tube filaments are good (Listed at
$115 each brand new at www.elexs.com/10Klyst.htm)

5 Mini-Circuits MAR-3 monolythic broadband microwave
amplifiers. These are spec'd from DC up to 2 GHz.
They are in their original sealed protective carriers.
And with data sheet/application notes.

5 2N5947 Low-noise low-distortion TO-117 stud RF NPN
transistor by Motorola for CATV and broadband amplifiers
5 Watt Pd, 400mA Ic max., 30 Vceo, 1100 MHz minimum fT
at 75mA Ic can provide photocopy of the data sheets

50 2SC1254 Low-noise UHF-VHF NPN transistor TO-72 case
by NEC. 800 MHz minimum fT at 6mA, 50mA Ic max.
25 Vceo, 0.25 Watt

5 80180 TO-117 stud RF NPN transistor by MEC for CATV
amplfiers. 5 Watt Pd max., 250mA Ic max., 25 Vceo,
1500 MHz fT

2 MPS6507 UHF-VHF NPN transistor TO-92 by Motorola 0.50
700 MHz minimum fT at 10mA, 100mA Ic max., 20 Vceo

1 MPS6511 UHF-VHF NPN transistor TO-92 by Motorola 0.25
1200 MHz minimum fT at 10mA, 100mA Ic max, 20 Vceo

4 MPS6547 UHF-VHF NPN transistor TO-92 by Motorola 1.00
600 MHz minimum fT at 2mA, 50mA Ic max., 25 Vceo

2 Isolated tab dual NPN RF transistors in special package
probably made by MA/COM. Looks like they are dual
common emitter RF Power transistors for CATV driver
broadband amplifier applications. I have no specs
but believe the part number start with "PH" as is a
common series by MA/COM. One says:
"N640 -12 and the other "W640 -12
PH2306 349" PH24010 313"
Rectangular tab with one mounting hole at each end,
and 7 .05" wide ribbon leads (3 on one side, 4 on other)

2 Mica compression trimmer capacitor 20 - 150pf
2 lug connections with a separate grounded screw
adjustment grounded through a centered mounting
bracket - flat base style approx. 7/16" x 7/8
rivetted plate (ie. cannot be taken apart and modified)

79 Mica compression trimmer capacitor 35 - 250pf
2 lug connections with a separate grounded screw
adjustment grounded through a centered mounting
bracket - flat base style approx 5/16" x 13/16"
part number 310720850061
rivetted plate (ie. cannot be taken apart and modified)

58 Dual separate mica compression trimmer capacitor PCB mount
with capacitors set in ceramic block 1 1/16" x 1 3/16"
with maximum height of ceramic 7/16" high.
Includes some silvered mica plates to limit range.
One capacitor is, 390 - 470pf,
the other capacitor is two sections in series:
first one 230 - 375pf, second 140pf fixed
Electro Motive part number 51102200
For you homebrewers, by removing the extra flat plates
(the slighty curved ones give the maximum variable range)
and just the silvered mica sections you can create various
combinations eg. 10 - 80pf with two plates one unplated mica
piece for the first section, and for the other section
20 - 120pf with three plates and two unplated mica pieces
or 10 - 75pf with just the top two plates and one mica piece.

241 Dual separate mica compression trimmer capacitor PCB mount
with capacitors set in ceramic block 1.0" x 0.7" x 0.25"
Electro Motive part number 310720850911
Includes some silvered mica plates to limit range.
One section is variable from about 390 pf to 480 pf.
The other section has a fixed 150 pf (approximately) in
series with a variable capacitance of 260 pf to 340.

These can be modified similar to the 58 units above.

8 NE5533AN Dual very-low noise Op Amp designed for 8
high quality low level audio preamplifiers

10 Solitron Devices, SD10, Sounvister - NOISE ZENER's 20
9V Zener diodes used as audio white noise sources in
much audio equipment. Comes with data sheet showing
individually tested noise outputs of 390 to
900 uV/20Khz @ 600 ohm, ordered by International
Rectifier (according to the data sheet) in 1975

1 Sigma Datacel # 301R2-24 optocoupler
with one lamp and two photoconductive cells

6 Clairex Photomod # CLM4012 optocoupler with one lamp
and one photoconductive cell with spec. sheets

1 Amphenol # 335-10871-3 SPDT coaxial relay 26VDC coil
silver plated with 3 miniature coax female (SMA?)
connectors, Date code 6836, but never used

35 DG180BP Dual SPST Very Low-Resistance (�10) J-FET 100
Low Distortion Analog Switches especially suited to
Video or Audio Switching purposes and precision Sample
and Holds, by Harris/Siliconix/Intersil list price
$20.20 U.S.! I have copies of the specs sheets for
you plus a summary of the data is at the end of this list
(FET switches unlike CMOS ones do not change resistance
with signal and so are extremely low distortion)

2 SHORTED General Electric C50 110 Amp SCR's free with
Electrically they are useless, but you might minimum $20
be able to use the braid on them. They are purchase
also great to hold by the braid and then whip but you pay
a mugger over the head with! ;-) the shipping

2 Used Piezoelectric Ceramic Blocks with metalized
ends. About 2" x 2" x 1 1/8". HEAVY

1 Double Disk converter/hole punch All metal construction $1.00
Yes the original product in the original box for you
antique lovers! Now if you can just find 3.5" 720k disks ;-)

80 USED - Miniature lamp holders with 24/28 volt lamps 5.00
plus 16 spare bulbs

12 Appliance neon indicator lamps with internal resistor 4.00
3/8" x 1 1/4" rectangular hole

9 Appliance slide switch 3A@125VAC plus 5.00
neon indicator lamp with internal resistor
3/8" x 1 1/4" rectangular hole

48 Knobs for 1/8" shaft Raytheon pn TSA50-2WL-1 9/16" dia
x 7/16" high. Fluted black polycarbonate knob with brass
insert with one set screw, white line up the side and
brushed aluminum circle on top. Electronics Goldmine
sells a similar knob (without the stylish brushed alumimum
circle) as their part number G9251 for $2.49 EACH.
Each in individual sealed bags.

3 Alco black machined aluminum knob for 1/8" shaft with
flat finger grip and thick aluminum skirt
numbered from 0 through 9

15 Various plastic knobs with set screws for
1/8" dia. shafts

12 Knobs for 1/4" shaft. 1 1/4" dia. x 5/8" high
Fluted black ABS knob with aluminum insert with two set
screws, NO pointer, with brushed aluminum circle on top.

12 Solid aluminum knob for 1/4" shaft. Aluminum coloured.
24 sided, with round front, 7/8" dia. max x 3/4" high
total. Smaller round base of 11/16" dia. for 1/4".
One set screw. Part brushed aluminum, part polished.
Nice looking. Has 1/32" wide metal insert as pointer.

3 Various machined aluminum knobs for 1/4" shaft

4 Various plastic knobs for 1/4" shaft

10 Large plastic knobs for 1/4" shaft with one set screw
Gold-coloured anodized alumimum cap, brown plastic
approx 2" in diameter and 5/8" deep

1 Strobe - flashes from 1 to 6 times a second. 20
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. (This unit and
the one below are in Hammond 1591C Heavy Duty ABS
boxes with 1591AC clear lids. These boxes alone cost
over $7 US each.) Runs off of the
AC outlet and has internal fuse for protection.
Uses FILM capacitors (3.3 &#65533;F) for charge storage.
The first item that "blows" on strobes are the
Xenon flash tubes, the other major item is the
capacitor if cheap electrolytics are used rather than
film capacitors. Film capacitors also have much
lower ESR (effective series resistance} and so are
usually as bright as strobes using electrolytic
capacitors with 3 times the capacitance.
(2 Linear replacement Xenon tubes are available for
$1.50 each, but only with the purchase of the strobe.)

1 Strobe - flashes from 2.5 to 14 times a second. 35
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. plus the size of

the external fan that includes a finger protector.
(This unit built in a Hammond 1591 Heavy Duty ABS
box with 1591 AC clear lid.) Runs off of the AC
outlet and has internal fuse for protection.
Uses Film capacitor (3.3 ÔF) for charge storage.
Because it uses the same capacitance as the $20
unit, but flashes up to 2.5 times as often, it
delivers up to 2.5 times as much power to the
Flash Tube. Includes a built-in fan to increase
Xenon tube life as well as using a special tube
designed for higher speed/higher power flashing use.
(4 Linear replacement Xenon tubes with data sheet,
are available for $4 EACH, but only with the
purchase of the strobe.)
WARNING: prolonged exposure to higher flash rates
can produce nausea and even epileptic-like seizures
in some people who are NOT epileptic.

1 6 Digit mechanical counter with 6 Digit preset 1
which drives relay - 93 Volts DC
could probably be powered by one of the
16VAC + 50 VAC listed below

1 ACE cylindrical key mechanical 7 pin lock 1
with 3 keys, for cabinet etc.,

16 25kÔ Linear 50mm-travel slide potentiometer 2
with centre detent - no 3mm mounting screws

Military Grade high-G shock resistant relays

1 USED Hi-G Inc. 26.5VDC 575Ô DPDT 2A contacts
20 x 10 x 10mm

1 Branson #AR6919 26.5VDC 390Ô 4PDT bolt-mount
20 x 23 x 10mm

7 16VCT and 50VAC ±6VA

1 10 VAC + 10 VAC; 6 VA pcb mount transformer
by Signal Transformer; Split Trans # DST-40-20

6 11 VAC ±3VA (ie. ±250ma)

1 9.5 VAC @ 200mA

2 14VCT ±4VA (ie. ±300ma)

1 18VCT and 60VCT (common center tap) ±10VA

1 25VAC ±3VA

3 12.6VAC ±3VA

2 30 VAC @ 50mA

1 12VCT @ 150mA

1 Used 34VCT @ 20VA - 120/240 VAC input

3 AC adapters 7.5VDC @ 300mA 3.5mm plug

2 AC adapters 4.5VDC @ 100mA coaxial power plug

2 AC adapter 16.6VAC @ 100mA no connector "Atari"

1 AC adapter 9VDC @ 100mA coaxial plug

1 AC adapter 6VDC @ 300mA no plug

MOTORS (cheap! No bid too low on the unreserved motors as long as your total order meets the $20 minimum before shipping is added.)

1 "MN-30 Micro Motor" by Tradeship (California) Inc
Open-framed 12 Volt DC 5 pole permanent magent hobby motor at up to 18,000 r.p.m. 3/32" shaft with gear about 2 1/4" long with mounts, 1/2" thick, 3/4" wide graphice brushes. In original box

1 "MX-77 Micro Motor" by Tradeship (California) Inc
Open-framed 12 Volts DC 7 pole permanent magnet hobby motor at up to 20,000 r.p.m. 3/32" shaft with gear about 2 5/8" long with gear, 5/8" thick, 7/8" wide graphite brushes. In orginal box

1 Sychron 20 r.p.m 24VAC 6Watt AC motor

6 3-12 VDC permanent magnet motors
body approx. 1" dia. X 1.5" long with 1/2" long shaft. Has graphite brushes

4 1.5-6 VDC permanent magnet hobby motors
body 0.5" x 0.8" x 0.9" long with 0.15" long shaft

16 Misc. USED motors with assorted voltages from 1.5 to 12 VDC, including motors used in cassette tape recorders and VCR's.

4 108 VDC permanent magnet motors 7500 r.p.m.
full-load current of 0.08 amps. Rated for 105±C @
20 minutes. Body approx. 1" dia. X 1 3/8" long
with 3/16" long "d" shaft

3 USED pancake type 12 Volt stepper motors
removed from old floppy drives

1 USED cube style stepper motor from an old Hard Drive
body approx. 1.5" X 1.5" X 1" with gear on shaft
short 3/4" long leads

1 New stepper motor Rapid-syn model 20V-03L 6
Impedance protected. 6 leads. I can't "feel"
the step size. 2" dia. x 2 1/2" long body.
Double shafted 1/4" dia. x 1" long at both ends
Three threaded mounting holes at one end -
two at the other

1 Used stepper motor similar to above 20Volt 3
somewhat longer shafts. 6 leads with connector
Rapid-syn model 20V-01J. Looks like one end is
meant to fit into a 1.75" dia. hole, with a ridge
presumably for holding it in just above this.
"Feels" like it is 3.6° step size.

1 Stepper motor used from HD. 5 lead with connector
Astrosyn model # 17PS-c006-01. 1 5/8" x 1 5/8" x
1 1/4" body. 5mm dia. x 12mm long shaft.

Misc:

2 5 pin 180° DIN male to four RCA males on 3' cord 2

1 5 pin 270° DIN male to DIN male on 7' cord 1

1 5 pin male to 5 pin male slide projector control cable 1

1 misc 3 pin heater cord with no AC plug 0.01 ;-)

1 1/4" male to 1/4" female shielded extension cable 0.75

3 1/4" male to bare shielded end cable 2

8 Elmwood Sensor series 2400 thermal switch 2
N.C. - opens at 84°F

10 Used Red bananna jacks 0.50

4 6 Amp 250VAC 11' long European colour-coded 6
sets electrical cords with no AC plug at one end,
and 3 prong modular female at other, plus
the matching Switchcraft EAC-301

1 Used optical shaft encoder - removed 6
1/2" dia. x 3/4" long shaft. All electronics connect
to 5 pin connector Housing about 2" in dia. x 2" long

SPEAKERS: (to be sold in one inexpensive batch) $ 5

2 5cm dia. 8° 0.3W

DG180 DATA:

DG180BP Dual SPST Very Low-Resistance (Ω10 Ω) J-FET Low Distortion
Analog Switches especially suited to Video Switching purposes
and precision Sample and Holds, by Harris/Siliconix/Intersil
They listed at $28.25 each (CND funds) at the time I purchased them.
I have full spec sheets and Siliconix price list that shows them at
$20.20 U.S funds in singles, $13.44 if bought in 100's quantities.

I was doing a video switching project with a friend some time ago and
chose the DG180 JFET switch because it had the lowest resistance of any
I.C. and because of its very low distortion, since JFET switches unlike
CMOS ones retain constant ON-resistance for varying analog inputs.
These 35 are what I had left over.

I will of course provide data sheets with the chips.

Here is the basic data on them.

DG180 by Silconix (and second sourced by Harris/Intersil)
Dual SPST JFET Analog Switches

Features:
* Constant ON-Resistance Over Entire Analog Range (UNLIKE CMOS DEVICES)
* Low Leakage
* Low Crosstalk
* The lowest ON-Resistance available in any IC

Benefits:
* Low Distortion
* Eliminates Large Signal Errors
* High Bandwidth Capability

Applications:
* Video Switching
* Audio Switching
* Sample and Hold
* D/A Ladder Switches

The DG180 is a precision dual single-pole, single throw (SPST) analog
switch designed to provide accurate switching of video and audio signals.
This switch is ideally suited for applications requiring a constant

ON-resistance over the entire analog range.

Reduced switching errors are achieved through low leakage current (Isoff < 1 nA). Application which benefit from flat ON-resistance include video switching, audio switching, and precision sample and holds.

Each device comprises four n-channel JFET transistors (in parallel) and a bipolar driver (TTL compatible) to achieve fast and accurate switch performance. In the ON state, each switch conducts current equally well in either direction. In the OFF condition, the switches will block up to 20 V peak-to-peak, with feedthrough less than -60dB at 10 MHz.

For the DG180BP (14 Pin Ceramic Side Brazed Package) by Siliconix:
(Part number DG180BK for the Intersil/Harris Ceramic DIP package)

Operating temperature range = - 25 °C to 85 °C

With V+= +15 V, V-= -15 V, and VL= +5 V:

Analog Signal Range Full temp range -7.5 to + 15 Volts

Switch Resistance @ Is = 10 ma Room temp 7.5 Ω typ. 15 Ω max.
Full temp range 25 Ω max.

Switch Saturation Current 2ms Pulse Duration 300 mA

Turn On time 240 ns typ, 600 max.

Turn Off time 140 ns typ, 250 max.

OFF Isolation f = 1 MHz, RL = 75 Ω typically > 55 dB
10MHz, RL = 75 Ω typ. 35 dB
50MHz, RL = 75 Ω typ. 20 dB

Also guaranteed to work with +12 Volts, -12 V and +5 V power supplies.

End of list

Joseph OM,

What do you mean by "digital modes"? (CW is the original digital,
ie, binary, mode)? AMTOR? PACTOR? RTTY? CLOVER? others? It makes a
difference.
For AMTOR/PACTOR/GTOR, RTTY, all you need is a reasonably stable CW
transmitter that you can FSK. That is what I use. I built a simple 40W
CW transmitter, and shift the VCXO up 170-200 Hz for marking, and
unshift for spacing. It is very simple to make CW/FSK transmitters.
You don't need the complexity of balanced modulators, filters, audio
string, and linear amplifiers. No linearity is required, of course (as
with any FM scheme), so Class C, D, E amps are fine.
If any of this is news to you, or you are unfamiliar with the terms,
then I suggest you do some reading in any ARRL or RSGB handbook Joe.

Vince,
I use a Epson Stylus 600 inkjet and plot directly to transparency. No problems whatsoever as long as you use proper inkjet transparencies. I also have a 300 dpi laser and to be honest I think the inkjet is better.

Rick OM,

Why mess up the back hatrack of your perfectly good '80 Volvo, with one of those 3rd brake lights? Do you really think it will make any difference? And, they are ugly (even in the 'spoilers'). What about air bags for it (the ones that are dangerous for kids and eat up all that usable space in the dash so that you end up with a micro-size glove compartment)? Antilock brakes (that do not reduce the statistical accident rate, but have the 'advantage' of requiring $1000 master cylinders)? Or non-CFC air conditioning (the less efficient, incompatible, inflammable stuff)? As the old saying goes, "the road to hell is paved with good intentions".
But, yes, they are 'trendy' (and PC), HI.
Sorry I am not any help; I guess I couldn't resist.

Hi,
I'm pete Aymond,KA5Kon. I copy about 18 wpm in my head and work c w
mobile.I had been trying to get my speed up
when a friend suggested working mobile so i could not write any thing
down! Guess what happened? After 3 weeks
I was coping 18 easily.NOT BAD when I had been stuck at 8 wpm fornearly
10 years.SO my advice to anyone trying
to get faster code is WORK MOBILE.You'll be surprisedt it will work!!!

From: Larry Benko <benko@aztek-eng.com>
Message-ID: <3741B7BE.763FBC3F@aztek-eng.com>
Source record: 70134

Approximately how much power can a BNC connector handle
at 2 meters with a reasonable SWR (e.g. < 2:1)? A SWR
of 1:1 would be 50V rms and 1A rms for 50W. Is this too
much power?

Thanks in advance,
Larry Benko, AC0B

Allan OM,

Been running mobile CW here for 18 years. I have seen several
mishaps with cell phone users and women putting on makeup in that time,
but no problem with CW mobile at all. CW mobile is very relaxing and
effortless to do if you are proficient in CW. And, it works very well
for ragchewing.

5148. please explain "terminations" in ARRL Radio Designer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-18 00:00:00 UTC
From: Bert Douglas <bertdNOSPAM@bellsouth.net>
Message-ID: <ZNj03.2727$Pk.833897@news2.mia>
Source record: 70137
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.cad,sci.electronics.design

Hi Net Folks,

Thanks for the help.

I am very confused right now by the whole issue of "terminations" in Radio Designer, and would really appreciate it if someone can tell me what is going on.

I am using a simple network of two resistors to try to understand what is going on. Here it is:

```
BLK
RES 1 2 R=100
RES 2 0 R=100
TEST: 2POR 1 2 0
END
```

In the Report Editor I set the following terminations:
port 1 = 200 + j0
port 2 = 10000 + j0

And I plot VG (voltage gain), which has a value of -12dB.

I am expecting a value of -3dB. So what is happening?

My understanding of the meaning of the terminations is that there is (effectively) an infinitely long zero-loss coax cable attached to the port with the specified impedance. Voltages are measured at the ports.

In the above example S21 has a value of about -25db.

If I set the input and output terminations to any equal values (including zero), then I get a VG of -8.87 dB.

Any help would be greatly appreciated.

Bert Douglas

Use the SD1446 from Thompson.
It is a drop in replacment for the MRF455, and will
operate at 60Mhz just fine.

5150. Idiot Question On FET Parameters

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-18 00:00:00 UTC
From: Robin Birch <robin@falstaf.demon.co.uk>
Message-ID: <T9L5YBAqPdQ3EwVf@falstaf.demon.co.uk>
Source record: 70139

Dear All,
Idiot question time again I'm afraid.

I have got very frustrated by looking at devices which initially look just what I want but when I come to work the details out only half, or even none, of the parameters I am after appear in the data sheets. Usually these are capacitance's or so on that I am looking for to calculate matching impedance's.

Now, I have found some devices that have things that look like what I am after but I just need to confirm that the names actually mean what I think they mean.

Ciss Capacitance between gate and source of common source JFET
Crss Capacitance between gate and drain of common source JFET
Coss Capacitance between drain and source of common source JFET

Is this correct?.

Cheers

Robin

Really, there should be no requirement for Morse Code. Why they even
got rid of the 500 KILOCYCLE Morse Code Frequency for ships.

The thing about Morse Code is that it seems that the OLD TIMERS are
saying that we did it and you should too. That is baloney. What some
cheese with that wine?

I must agree that due to intl. treaty users on the hf bands are required to and should know cw. however I dispute the use of a speed test in that particular language for upgrade or access to spectrum. 5wpm satisfies the intl. treaty, we should be testing on tech. knowledge or added knowledge of the rules and regs, for upgrade purpose. It used to be that you needed to know hand signals for your drivers test. I believe they dropped that requirement in my state, but even if it was still in place, should we test how fast one can give them to upgrade our drivers license, or how fast we can recognize various shapes and colors of road signs. No of course not and speed should not be an issue in amatuer radio cw. Only a working knowledge of the code is needed and that is what should be mandated. If an individual wants to use cw to a large extent and increases their speed, so be it, but for others that use fm ssb etc. basic working knowledge is all that is necessary and all that should be required.

Well said.
I'm thinking of one area where I use Morse outside of ham radio: flying. Navigation aids identify in Morse, but a 5 WPM proficiency suffices. Good. I like your idea.

No, I'm saying that if you want the same license I have, pass comparable tests.
Is CW relevant? The Navy thinks not. It's still valid and satisfying.
I'm no 35 WPM Extra, just an Advanced. I took my last code test at the Dallas
FCC office in April of 1964, 13 WPM. The damn government already stole my First
Phone, I don't want it to redefine my ham license, too. Just create a new
ticket? Been done.
The service does need to evolve with technology, no one uses spark much.
I have no simple solution.

I'm looking for: Motorola STX model 821 or MTS 2000 Flashport series radios. They must be 800mhz and Smartnet ii capable. These are for a small dept. here in the Indy area that is looking for a way to get around paying the enormous price of new ones from the local radio authority. If they have extra batteries or chargers or public safety mics that would be great also but not needed. Anybody that has these in good to fair condition can e-mail me at paramike@indy.net with prices and terms, I will forward the info to the chief of the dept. inquiring about the radios. Thanks for your help, Mike

I've tried this, and it works reasonably well. It's a bit tricky getting the correct UV exposure time, as the paper is a bit opaque and the print isn't really opaque enough. I think I could get a single track between IC pads, with a bit of care.

5164. Data needed for NEC Diode Mixer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-18 00:00:00 UTC
From: benedict69@hotmail.com
Message-ID: <37435774.3958567@news.bigpond.com>
Source record: 70153

Hi,

I'd be grateful if someone can help me locate the specifications for a NEC diode mixer, type 7110Z. Physically the diode mixer is very similar to the Minicircuits SBL style of mixer.

It appears, unfortunately, that the NEC website carries no information on this component.

5165. VK5 - Please help with VHF FM Crystal Filter bandwidth specs.

I was away when this thread started, so I'll add on here.

I have all of the hr issues. I was an early subscriber to comm quart, but quit because it's too damn expensive for what you get. I'm on again an off again with QEX (currently on).

Fisk was a good editor, even though he screwed me with his Radio Kit copy of my speech processor. Early on, hr paid for articles upon acceptance, although when Alf Wilson took over after Fisk's death, that policy changed. (I got screwed again with that change)

QST at the time did not pay for articles and I think that hurt them in the sense that the techie stuff went to hr.

As to the ads supporting the publication, I guess that is true, although QEX has few ads and QST is mostly ads. It is clear that ARRL is no longer a ham organization, but a publishing house. If you don't think so, count the number of pages of QST devoted to ads for ARRL. Last time I counted, there were 18 pages of ads for ARRL stuff. No wonder there isn't room for tech articles.

I would buy the hr CD if it is reasonably priced. I could use the storage space.

I suggest checking the negative bias voltage on the 6DQ5 final. While you're in there (with one hand in your pocket!) check the screen and plate voltages on the final, too. Have you already satisfied yourself that the 6AG7 voltages are okay? Sorry, I do not know off hand what these voltages need to be, but it sounds as though the final amp may be cut off, or the amp section of the 6AG7 may be asleep.

>with a bit of care.

Good results depend on getting the best possible "black/white" contrast.
The better the contrast is, the less tricky it is to find an acceptable
range of exposure times.

Printing on tracing paper will probably give better contrast than
transparent film, because the black is denser on paper. Some grades of
tracing paper will be more UV-transparent than others, so you may have
to experiment if quality is critical.

Obviously you need to set the printer to give the densest possible
black. A laser printer will generally give a denser black than an
inkjet, so it may be worth asking a friend to print your final version
on a laser.

I am in need of a regulated 0-50v 0-50 amp power supply.

I have been offered a Harrison Laboratories model 6456
which is a 0-36v 0-100a supply for $100.

Does anyone know if this could readily be converted to
a 0-50v 0-50a supply?

Does anyone have a schematic with component list and/
or a manual?

Is Harrison Labs still in business?

Thanks! & 73,

Need infos about this RF UHF Motorola transistor in case 319
(metal-ceramic rectangular,base and collector opposite, emitter as 2 +
2 straps on sides).
Seems to be used as medium power driver on cellular repeaters, but it
is no mentioned at all on Motorola RF devices Web page nor in the Web
with usual search engines.

Need Vce, gain, Fmax, Pmax and pin assignment.

Anyone can help an experimenter on 23cm?

>
>I am expecting a value of -3dB. So what is happening?

What is happening is that you are relying on software to such an extent
that you are unable to think. You have a 200 ohm source feeding a
potential divider made from two 100 ohm resistors, and 10 kohms across
the lower one. Neglecting the 10 k, you have 300 ohms in series with 100
ohms, so the output voltage is a quarter of the source voltage, or -12
dB. You wouldn't ever get 3 dB, which is half **power**, not half
voltage.

Realising that attenuations are measured with respect to the *source*
voltage may well lead you to the solutions to your other questions.

You should compare the number of driving cell phone users and the number
of driving cw op's. Maybe this explains the small number of accidents
involving the cw op's.
I mean, when you are a good, experienced cw op, you may have no prob's,
but if yozu are still on training in cw, you must pay much more
attention to the cw sigs, as it would be wise on a full highway...

I don't see any groups listed where the Morse Code issue would not be appropriate.

All but two are amateur radio related, and shortwave and scanner listeners have to listen to (or try to avoid) Morse Code too.

> apply and take it off soc.penpals.

Let me try to explain. When people reply to a post on a newsgroup, they don't usually read what newsgroups are all listed and delete the ones they THINK are not appropriate. They just hit send, and it goes to all the newsgroups the original post was on. Blaming the person who replied to the post is silly, he did not choose the newsgroups listed.

And to delete any of the groups would be just as silly, because you are sending a reply to the post and don't know which of the groups he will be checking back to read your reply, so it makes sense to leave everything as is.

Why do people hate logic and common sense so much?

Two of my friends are pilots and say this is a bunch of bullshit.
Neither of them had to learn morse code to get their pilot's license and
don't know of anything used in flying their planes that would need to
recieve morse code for any reason.

5189. Help with using PSpice

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-19 00:00:00 UTC
From: Mark Jones <mark@umr.edu>
Message-ID: <37434d2c.0@news.cc.umr.edu>
Source record: 70095

I am trying to figure out how to use an op amp in PSpice using the text based way of design (writing a .cir file yourself instead of using Schematics and drawing the circuit) and I can't figure out how to use the standard uA741 op-amp or a downloaded model of the National Semiconductor LF 356 op-amp. Does anyone know how to do what I want to do?

Thanks,

Mark

PS Part of my .out file from the analyis program is below:

```
Vin 1 0 AC 1
Vcc 101 0 DC 12
OA 0 1 101 0 2 uA741
--------------------------------$
ERROR -- Unknown parameter
R1 1 2 100k
C1 1 2 3p
R2 2 3 10k
C2 3 0 0.082u
R3 3 4 10k
C3 4 0 0.068u
R4 4 5 10k
R5 4 6 20k
C4 5 6 0.0056u
OB 0 5 101 0 6 uA741
--------------------------------$
ERROR -- Unknown parameter
```

I don't know what letter I'm supposed to start it with so I chose O hoping that might be right. And if I get the right letter for the name of them, what is the format for using them, because what is above doesn't work obviously.

5190. Re: Linear with 4CX-250s

Steve,

Are you interested in being a "tube tester"? I have a
number of 4CX300s in the junque boxe. I have no idea what
condition they are in.... If you are intereseted in testing
them let me know. You can keep half of any good ones. If
only one turns up good it would be yours for the testing
effort.

Has anyone done a conversion of the Clipperton-L so it will cover the WARC bands?

Yeah. I found this really interesting. But what has all this got to do
with Soc Penpals? I don't really care anything about radio
communications of any sort. So why not just keep this on the boards that
apply and take it off soc.penpals. As far as I am concerned amateur
radio is atrocious, even worse than CB used to be here. I have never
heard of so much crap on any wavebands before. How these people get
operating licenses is beyond me.

5204. Literature about microstrip construction

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-19 00:00:00 UTC
From: hb9dnn@gmx.net
Message-ID: <37428b56.1194335363@news.hasler.ascom.ch>
Source record: 70171

Hello,

does anybody know of literature about microstrip construction?

All I have found up to now are books like the ARRL microwave
experimenters/projects manuals one one side (only very basic coverage
of the topic) and on the other side very abstract textbooks covering
transmission lines and/or microwave filters in a more theoretical and
mathematical way.
What I'm actually looking for is some kind of 'cookbook' dealing with
the structures used in microstrip circuits.
In other words, I could simlpy build one of the famous KK7B circuits
and have fun working with them. What I'm looking for, however, is
how these circuits work, how You calculate and construct these
structures, etc.

Thanks in advance for any pointer

Robert

5206. Morse 1991-1997

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-19 00:00:00 UTC
From: Con Daly <radioman27@hotmail.com>
Message-ID: <M%y03.5961$xa.54353@c01read02-admin.service.talkway.com>
Source record: 70173

Hello everyone,

I don't read the posts from this group much and am'nt as active as much
I would like to be on the air. However I see a lot of debate going on
about morse. It seems to be the most passionate issue among amateur
and professional radio operators these days. I sailed as a merchant
marine radio officer from 1991-1997. I found morse to be absolutely
invaluable at that time (not terribly long ago). There were times
when I really could not have managed without it. This was not just
a matter of equipment on board as I often sailed with Inmarsat
terminals, both A and C systems which were supposed to be well
established at that time.
I have countless stories about satellite null zones along the equator
and many other areas, extremely weak signals on SSB etc, where the
only option available was to use morse. Indeed on one particular voyage
on board an Inmarsat-C equipped vessel I was using CW 90% of the time.
When the first changes started to appear with the introduction of the
new maritime radio system (GMDSS), there was any
number of mishaps occuring with ships normally having no communication
problems suddenly "dissapearing" from the air for days on end.
The ones which still had radio officers had no problems, as with the
ones with electronics officers who were former radio officers.
Having come close to shipwreck on 2 occasions I expressed great concern
about the changes taking place, as they seemed to be rather
premature and rushed and there was a desperate drive to get it all into
place before the millenium.
Now don't get me wrong, I'm no old salt and am always
keeping up to date with electronics and the latest innovations, but
morse should not be seen as simply old technology, it is just another
method of communication, proved itself very reliable again and again up
to the present day, I can vouch for that. Certainly
new communications technology should be introduced to all fields,
amateur or commercial. Especially when the high traffic needs of todays
industry are demanding it, but it seems that certain people
are just determined to get rid of something that they never embraced
because they never saw it in the right way. Morse is not a code, it
is a language. That is the first mistake a lot of people make in the
way they approach it. Certainly those people more musically inclined
will tend to like it more than others (I play 5 string Banjo), but
like learning an instrument, it takes a lot of time and effort and
can be frustrating.
Ok, so I'm obviously an advocate of CW but you may
be surprised to hear that I'm not in favour of keeping the requirement
for a proficiency test, if thats what people want. I just wish that

those against the code requirement would take a long hard look at what they are really campaigning against. It seems like it is really based on an irrational belief that it's too old fashioned, but really fashion shouldn't come into it. It certainly didn't matter for me in the Mid atlantic when we were taking on water faster than the pumps could get rid of it down in the engine room. That was in 1992 and there were other less urgent incidents right up to the time I left in 1997.

Certainly the amateur service is'nt as important as a shipboard radio installation or a coastal station but all you anti code people out there, please, take a good look at what you are starting. Because there will be no going back and it will be dead within 20-30 years of a no code requirement. The commercial people made a mistake, based on purely financial motives. 12 WPM is not difficult to obtain if it is learned the right way. At least ask yourselves is it really the requirement you are trying to get rid of or is it the whole art form itself. I hope I have at least provided some food for thought and that it will add some new and interesting insights.

73's

Morse Code is a "turd in a punch bowl". It is the reason that ham radio
will die. It is really unfortunate.

Motorola only characterized this device to 30 MHz, but since it's
pretty linear to the end of characterization, you have to assume
the linearity continues for a ways.

Motorola has published some test set schematics for their HF RF
transistors, and you could easily adapt any of them for use with
the '455 if there's not one already out there.

My experimentation with this device and with harmonic-rich HF
input signals suggests good usability at 6 meters, although you should
expect somewhat lower output. Would you be happy with 50 watts out
from a push-pull pair at 6 meters, driven with 4 watts?

From: Michael Young <nobody@all.org>
Message-ID: <927186986.671.86@news.remarQ.com>
Source record: 70104

I put one up on the roof about a month ago. So far, I've worked (from Illinois using 100 watts) 30 states including Hawaii, Argentina, Spain, Portugal, Costa Rica, Guatemala, Caribbeans, Germany, and Norway. That's not saying much, since it depends very much on the bands. When the bands are open, the antenna will do the job. VSWR bandwidth is a bit narrow on 40m and 80m, but fits my needs there. Twenty meters and above are plenty wide.

It's a good antenna. The parts are generally good quality, and looks to a layman (me) to be well thought out. The only real problem I had during assembly was with the threaded aluminum rods. The rolled threads are not fully formed; you should run a die (I think a #10) down the threads before trying to install them. Also, the kit was missing 4 split lock washers. Otherwise, it's pretty straightforward and goes together well.

The top counterpoise makes it somewhat wobbly in a breeze. In 40 mph winds, the top sways a good 6 to 8 feet. I'm not certain what effect the sway has on the radiation pattern. I was also concerned enough that I added guy wires to the TV antenna tripod. I don't know if this was necessary, since it's still up there and holding.

In all, I'm pleased with it. It meets, maybe exceeds, my expectations, but I have nothing to compare it to. The band coverage fits well with the new multi-band all mode radios. I think it's an excellent choice for HF through VHF coverage.

Michael.

I am the first to agree that many lack common sense these days, but what
happened to all those complaints we used to get from newsgroups that
your posting was 'inappropriate' to the newsgroup in question!
Let's suppose we broadcast this thread in say uk.misc or talk.bizarre,
or maybe even soc.culture.israel then they would soon let us know about
it!

Harrison Labs was a Hewlett Packard owned company that stopped operating in the early seventies as I remember. They (HP) also had a company called Dymec that made power supplies. The Dymec symbol was the HP logo turnned upside down. Lower case letters were used for both symbols. Dymec was a mid sixties company.

It is unlikely that the unit would be easily convertable to 50 volt operation. It is most likely a linear supply with a pre-regulator or a tracking Variac on the input. It will also not use silicon transistors. It will be very heavy and either single phase 220 volt or possibly 3 phase 208.

Although I have no preference of the two radios you listed, they both will
work for packet radio, at least at speeds of 1200bps.

Hello All, A friend of mine has bought an imported second hand Mitsubushi pajero(shogun in UK), The radio Tuner in it only goes up to about 100Mhz on FM rather than the the usual of about 108 Mhz.
My friend has been told that it cost a lot of money to have a "frequency expander card" fitted.
Dopes anyone know just what this conversion entails and is it possible for me to get the parts and do it for him?

Unlikely. The transformer would not have the voltage necessary to do
this. I don't think these were switching supplies.

>Is Harrison Labs still in business?

It has long been a part of Hewlett Packard.

> Thanks!!

I'm kinda partial to the VX5-R. I bought one a couple of weeks ago and cannot put it down. The small size and the 5 watt output were big sellers for me. I'm burnt out on packet, so that wasn't an issue. I also like the ability to program the radio as I like it using either ADMS or EVE software. It does a good job even on AM broadcast and the SW bands with a good antenna. It is am amazing little radio given its' size.

Dan

Howdy Con....BRAVO!!!! I to have somewhat paralleled your shipboard time.....R/O from 1979-1998....still have my RGMC and picked up the rinkydink GOC GMDSS, installed (I used to work as installation tech and then R/O) my first GMDSS in 1997 and had a chance to work with it for a year.....(the semi-submersible drill rig I was on required R/O's up here off of Canada).....been a ham since 71 and have seen the changes and EVERYTHING you echo is true bro.....shame that the GMDSS didn't provide for bringing over something (or exactly) like Q sigs just for the universality of that part of our language. I remember many times when I was unable to contact a radar target on collision course with us by voice but was able to get a reply from my TTT or XXX on morse directed at the target. I could go on and on as you to could....at the end of 1997 I shook my head as I counted nearly 700 FALSE or undetermined distress messages on the GMDSS....no wonder so many turn it down or..... Morse transcended our voice language/accent/dialect barriers by causing us to sound alike (sort of heheh).....relatively simple gear that could be troubleshot and repaired at sea. I guess my own point is as yours is that those who won't use it will never know how good it is....and those that will and have, know better...truely a shame to hear the cursing over a mode/language/method of communication that HAS stood the test of time by being useful for a hundred years.....

Well, Keith, we used to talk about DX. But then all these Morse code
geeks and hot women from SOC.PENPALS started posting here and
looks like everybody who was interested in DX left. Haven't seen
anything DX related for quite a while.....

That is a silly question since the answer itself is common sense. If people were logical then who would have babies? Betamax video recorders would still be in use in Europe and Jesus may not have been nailed to a tree! If there is a God then perhaps she is sitting up there having a damn good laugh at us all - I am.

It is a freeware package for the VX5. It seems like a good program, but

I haven't had a chance to use it much.

The URL is http://www.geol.com/vx5/

I have a Mitrek in the 2m range complete with head
and cables and three freq. modules.

I am looking for a kit, a design for, an already built, or
recommendation for a readily-modifiable VFO so that I
can free the rig from freq. modules ... anyone know of
such a thing?

If not, anyone know what the requirements would be to
implement a VFO for the Mitrek in the 2m range? Any
gotchas?

Thanks! & 73,

Don't foget Spark Gap. For those of you who do not know what DX is; it
means receiveing a radio/television signal from far away. From far away
as in you usually do not get a signal from this place. DX can also mean
how far your siganl is getting out. From everything that I read; if you
can run just 10 watts, and your siganl is getting out 300 to 400 miles
then that is better DX then somebody running 1000 watts and doing th
same thing.

Since when do TV station broadcast in one colo(u)r as the name
Monochrome would imply. Heck, even Black and White is two colo(u)rs.
By the way, the best Black and White is what is know as a Twistee cone.
That is when they combine Vanilla Ice Cream with Chocolate Ice Crea.

First of all I have a commercial pilot's license with airplane single and multiengine land and instrument ratings. I have been flying since 1967. I own and fly a Baron. No I didn't have to learn Morse to identify navigation aids, the CW is printed right on the chart or approach plate. The statement "don't know of anything used in flying their planes that would need to recieve (sic) morse code for any reason" is fascinating. What do your friends fly? Ultralights? What are their license numbers? Mine is 1774847. My Baron's call sign is N502TB. When you tune in an NDB, a VOR, or an ILS you are taught to listen to the CW identification to confirm that you have the correct station. This takes more time if you have to look at the chart or approach plate to see what the CW is rather than just hear the ID.

The formula will give you the flux density all right, but it
won't tell you the maximum flux density a core will handle.
The Amidon book gives a table of maximum flux density versus
frequency: 500 Gauss @ 100 khz, 150 gauss @ 1 Mhz, etc. down to
30 Gauss @ 28 Mhz. The information should be on the Amidon
website.

5260. Help-QST/QEX articles urgently wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-21 00:00:00 UTC
From: oxf01@ukmax.com
Message-ID: <37450E54.5757@ukmax.com>
Source record: 70122

I urgently need a copy of two articles in QST & QEX. The months are QST may 96 and QEX jan 95.

Is there anyone out there who would be able to send me a photocopy (or even fax) of the articles concerned? I will pay all copy and mail charges (I have a US bank account).

Please e-mail me directly to oxf01@ukmax.com.

tia,

Mike, G4COA

That's because you're not familiar with the rec.radio hierarchy; here's
a reminder:

Subject: List of the rec.radio newsgroups
Followup-To: poster
Approved: news-answers-request@mit.edu,rec.radio.info-moderator@primenet.com
Distribution: world
Expires: 01 June 1999
Summary: This article provides a list of the rec.radio newsgroups; it is
posted alternately with the longer "Guide to the Rec.radio NGs"
Keywords: radio amateur ham cb scanner shortwave netiquette
X-Last-Updated: 1998/03/29
Version: 1.1 created 98/03/05 03:50:23
Posting-Frequency: posted on the 1st of each month

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O, and your friendly rec.radio.amateur working-group

Apparently not any more. Neither of my friends ever HEARD of this BS
and they both have licenses and fly planes. Perhaps back in the 60's
things were different.

Right now. Right here. You don't know anyone in aviation. I flew my last IFR cross country Thursday. Damn if the Centex VOR didn't go _. _. ._ _ _._ "CWK". Then the Waco VOR went ._ _._. _ "ACT". Then the Waco ILS went .. ._ _._. "IACT". The Navaids that don't do it (CW ID) are LORAN and GPS. Pack up any sectional aeronautical chart or approach plate and the
CW is printed next to the Navaid identifier. That's the last for your troll, wankstain.

5274. AMIDON iron powder cores

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-22 00:00:00 UTC
From: Alain <alain.dumont@wanadoo.fr>
Message-ID: <3745EC92.284DD749@wanadoo.fr>
Source record: 70058

Hello,

Could anyone tell me what is the MAX Flux Density
that can be supported by the Amidon iron powder cores.

Especially for the "red" and "yellow" one.

If you have the information for the others "colors"
it will be welcome.

I manage to use the following formula

Flux Density=(Epk x 10^2) / (4.44 x Ae x N x f)

Where
Epk = applied peak RMS volts
AE = cross section in cm^2
N = number of turns
f = frequency in MHz

I found this formula a long time ago in this news group.
I hoppe is correct and give the flux in same unit than Amidon give it.

Thank you

Message-ID: <3745F043.358B3456@wanadoo.fr>
Source record: 70059

Hello,

I found at flea market some vaccum relays from JENNINGS
Models are:

RF4D-26D2495 and RB1D-26N300

I would like to know the following informations for each:

- Max HF current flowing through the contacts (when closed)
- Max voltage between contacts (when open)

AND MORE

The model RB1D-26N300 seems to switch fast enough for operating
in full QSK (for CW at 25WPM)
I have tested it and found a closing time of 15ms and opening time of 10ms
BUT, i don't know if this relay is able to switch on/off millions of times
as it will be necessary in QSK CW.

Does anyone know the "life time " given by JENNINGS for this relay ?

Thank's a lot for any informations

You couple DC (or low-frequency AC) power into the coax in the house,
using a RF choke to keep the radio signals from getting into the power
supply and a capacitor to keep the DC from feeding back into your
radio. Then, you use the same circuit in reverse at the antenna/antenna
switch. The diagram is pretty simple, and inexpensive to build, but I'm
REALLY bad at ASCII art! If you want, I can email you a .GIF file of a
schematic.

I need to replace a pin diode (KS4522 or M1308) in my Ten Tec 1210 transverter (self built).

Can anyone suggest a suitable replacement for this diode. It seems that both the KS4522 and M1308 are absolete and no longer available in the UK.

Peter

I don't know if they are still around, but GLB used to make a
synthesizer kit. It selected TX and RX frequencies separately.
You could also select reverse at the flick of a switch. I used
one on a Mocom 70 for many years.

Sorry I couldn't be of more help. I think the synthesizer would be
much better than a VFO, as at least you could then use any
repeater in your area.

Check HP's web site at http://www.hp.com and look under
electronic components.

Also check Alpha at http://www.alphaind.com .

Also try Infineon Technologies (formerly Siemens
Microelectronics at http://www.infineon.com .

I don't know the characteristics of the PIN diodes you've
referenced above, but both HP, Alpha, and Infineon (ex-
Siemems) have wide selections.

As a last resort, you could try the 1N4007 ... while it's
a high PIV 1A rectifier, it has a PIN structure (it's the
only one of the 1N400x series which does). It may work,
but may not be the optimum choice for your application,
depending on frequency, power level, available drive
current, etc.

73,

Hi,

Yours is a very strong testimonial. I have never participated in any of the debates beyond reading other peoples' comments and watching flames erupt.

In spite of your irrefutable points there are folks who will scream. I'll share some of the heat this time around (grin).

I haven't seen any anti-morse statements that didn't appear to be lame excuses from lazy people. Never mind about reason or logic.

I wouldn't characterize myself as "anti-morse" at all -- in fact, I'm actively working on that skill now -- but I think it's too facile to dismiss the debate as "lame excuses from lazy people." Incentive licensing makes sense to me, but consider the upgrade from Advanced to Extra. The written test is actually easier than the Advanced exam, but we require 20wpm code. Is 20wpm code speed more important than, say, more technical knowledge about microprocessors? Why not a soldering test? How about a DSP programming test? Among those who aren't just "lazy people" the debate, IMHO, is more about which skills are most valuable, and which skills are less valuable. Personally, I'll continue to work on my code speed regardless, since I intend to use it, but not every amateur does. A friend of mine refers to himself as a "no-code Extra" because it has been so long since he used code, he no longer remembers it.

If you're going to be pedantic at least check your facts first.
Monochrome - (of, using or being) reproduction or execution in 1 colour,
black and white, or shades of grey.
And technically speaking, black and white, being the absorbtion or reflection
of the whole spectrum, are not colours.

513A "Q" standard, 249uH, in the felt lined Boonton mahogony box
with application instructions. Looks excellent, almost new. $20

4 standard inductors, Model 103A for the following frequency ranges:
.8 to 2 MC - 100uH
1.5 to 4.5 MC - 25 uH
5 to 14 MC - 2.5 uH
20 to 35 MC - .5 uH
$10 each

3 older style standard inductors, silver plated cases
50 to 150KC - 22.5 mH
4.8 to 17.5MC - 2.44 uH
14.2 to 50 MC - .28 uH
$5 each

$70 shipped for all of them. If you want less, then indicated price
plus shipping.

regards,
Chuck...

Hello Carter,

1962 Handbook, pages 178 to 181, I presume. I need more info, though.

First question: Are you using crystals or VFO, and what band(s) are involved? (both frequency of xtal/VFO and frequency of output circuit). For example, "40 meter xtal tripling to 15 meters" - "80 meter xtal operating straight through".

Second question: Is the metering circuit in your rig an exact copy of the Handbook circuit? If not, how has it been modified? The original shows a 15 mil meter - 2 mils will hardly budge it. Old meters can be inaccurate - you might want to check the metering setup before you do anything else. Here's how:

Disconnect the rig from the power lines and antenna, and remove the 6DQ5 tube. Get a known good meter (VOM is handy for this) a 1.5 volt battery, and fixed resistors of about 150 and 750 ohms. Hook the battery, resistor, and VOM in series - you can compute the current by I = E/R (A 1.5 volt battery and a 150 ohm resistor will produce a flow of 1.5/150 or 1/100 amp - 10 milliamperes).

The VOM should read about 10 mills, or a little less (the VOM has some resistance). Now disconnect the negative side of the battery from the series circuit, and connect it to the rig's chassis. Put the lead removed from the negative side of the battery into Pin 1 (the grid) of the 6DQ5. This puts the VOM/resistor/battery circuit in series with the metering circuit of the rig. You should get a very low reading, if any. Now short out the 47 K grid resistor - you should read about 10 mils on the VOM and 10 mils on the rig's meter. Substitute the 750 ohm resistor to see what 2 mils looks like. If the VOM reads but not the rig's meter, you've got a bad metering circuit. If the rig meter works fine, something else is wrong.

Third question: Have you tried various 6AG7s and 6DQ5s? Old bottles that look good may not be, particularly in RF circuits. But don't chuck out a suspect until you KNOW it's bad.

Fourth question: Have you checked the plate and screen voltages on the 6AG7? The circuit shows 400 volts on the plate, and an adjustable screen voltage. The circuit will still oscillate with the plate circuit open, and with very low screen voltage. RFC2 may be open, or the wrong value.

Fifth question: Listen to the signal on a receiver. Does it peak sharply when the 6DQ5 grid circuit is tuned to resonance? A dipper's calibration has to be checked against a receiver - they are notoriously inaccurate.

A single 6AG7 crystal oscillator of the type in this rig (it's a "grid-plate" type) will produce well over 8 mills of grid current, when doubling to 20 meters - enough to drive a pair of 807s. Higher order multiplication efficiency frops fast, though.

My suspicions are:

- Bad tube or other component
- Defect in the metering circuit
- Inadequate drive to 6AG7
- Bad bypass or coupling capacitor
- Bad grid leak resistor
- Wrong voltages on the 6AG7

Note that you have to close the key to ground the 6DQ5 cathode to get any grid current flow.

I have lots and lots more suggestions - the above is just a start.

it was made by Siemens, but is now obsolete device
It has similar but perhaps simpler functions compared to NE612, at
least it is easier to connect the xtal in the oscillator part of
NE602/612

Hi Ed,

Lets see now...

You are working on your code and you have some reasonable comments (grin).

There are a lot of hams who do not intend to use code and are happy with no-code licenses. They do not complain about the *other* priveleges they do not have because they do not want to learn or use morse. I don't have any argument with those folks either. The lame excuse approach comes from wannabe's who want the priveleges without the responsibilities.

I remember having to learn a little about how to make a satellite transponder and a little about how to make a repeater. I have no intension of building either, but the questions were there on my exams. No complaints from me. I just did what I had to and promptly forgot about building satellite transponders and repeaters.

Much of the additional extra class frequency spectrum is at the cw end of the bands :). I guess morse proficiency would be appropriate for that exam. I seem to remember answering a couple of questions about non-morse issues on the extra exam. Easier and tougher are subjective, but I agree about the extra exam being easier for me. Maybe by the time we get that far all of it is getting easier. I thought a question about installing sound bars on a neighbor's TV was ludicrous, but if one knows nothing about TVI.....

Your no-code extra friend learned the code well enough to pass the exam. No excuses from him (her?). I know some hams who achieved the license they wanted and promptly abandoned morse code and some who didn't even have to learn morse for their ticket. They are all happy and none of them ever complains about the morse requirements.

I still dismiss the anti-code folks as lazy excuse-makers.

Bill KU8H

The term 'DX' was originated by amateur radio ops.Others use it to
mean different things.The original meaning of DX is to make contact
with a station in another country.This is required to qualify for any
of the ARRL DX awards that many Hams persue.You can call a dog a cat
if you wish...it dosnt change the fact that its still a dog....:>)

From: Brian <schousek@geocities.com>
Message-ID: <7i9bgu$30i$1@jair.pressenter.com>
Source record: 70003

Somewhat irrelevant to the 2n5109 request: Zetex makes available their entire library of spice models available along with graphical symbols usable in the PSPICE evaluation software. www.zetex.com I find that this causes me to design in Zetex parts to the exclusion of others. They are available from DigiKey.

Now for a little trivia- does anybody know how Digi-Key got started before they became a parts distributor? And why that question is relevant in a ham newsgroup? Brief history at: http://www.digikey.com/MKT/C_Hist.html

You know, historically if a person requested a response via email there was a flurry of 'if you don't have the time to check the newsgroup I don't have time to help you' flames. It seems that lately someone who doesn't put a valid email address gets the same flurry. You just can't win for trying I guess.

5315. ECL BCD Decade counter IC

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-23 00:00:00 UTC
From: John Mortlock <jmort@global.freeserve.co.uk>
Message-ID: <7i9dbj$12j$1@news4.svr.pol.co.uk>
Source record: 70004

Does anyone know of an ECL BCD Decade Counter chip ?

There are a number of ECL divide by 10 prescaler IC's about but they dont have BCD output. Plessey used to make one (SP8635) but this is now obsolete. I am looking for a chip that will work to at least 1 GHz preferably higher.

John

"Monochrome" refers to the CRT having a single electron-beam gun and
a single-color phosphor on the CRT's screen.

Mono = single.

Depending upon the CRT's grid voltage, the beam+phosphor can create dozens
and dozens shades of grey.

There's likely a TCXO (temperature compensated crystal oscillator) in there,
though it might not be a convenient frequency. There is a VCO or two that
will operate up to 900 MHz, plus the other chips needed to produce a PLL
at that frequency. There's a power amplifier that operates at 800+ MHz,
good of 0.6 W output. There is a crystal filter or two.

Some of this stuff might work at 440 MHz, and some might work up at
900+ MHz.

connected in series and assumed to be 'complimentary pair'.......,
why?
assume they are for different stages, perhaps 'ZRF' is a TRW prefix,
they made some series of RF transistors, usually with the "PT"
prefix, have seen some "ZRF" devices, but they are 30-35 years old.
Usually it isn't worth keeping unknown and old smaller RF devices, if
it looks like an output power transistor it may not be much value for
2m PA, but it is a wonderful device on 6m, possibly 20dB gain
>>> I assume the latter two are a complementary pair.

5322. 4-1/2" round meter movements f/s

I have at least 20 round meter movements from military v.o.m.s. Rugged steel constr with AC V, DC V, and ohms scales. 4-1/2" o.d. with 3-1/2" face, $4.00 each plus UPS. All are 50 uA movements made by Bruno, QVS, or Phaostron. The unit can be opened up to remove or painted over the scale for a custom power meter, ammeter, etc. Four styles available, with blue or black bezel, and with entire meter visible under clear cover or with bottom third coverd by the bezel. Also have a few with an extra set of terminals to detect a "pegged" condition, for $6 ea. Call 334-347-5281.

Try connecting a Motorola 10EP016 as a divide by 10 using feedback
gates. It should easily do 1 GHz and put out BCD.

From: Henry Knoll <knoll003@tc.umn.edu>
Message-ID: <3748B343.32AB@tc.umn.edu>
Source record: 70013

Looking in the ARRL Handbook in the Filter section, I see graphs of low pass filter responses that have as the ordinant all of the following: transmission loss, equivalent loss in percent and SWR. I don't see any information in the Handbook relating these quantities. Does anyone know where to find the equations that inter-relate these quantities please? If there is a good article on this in a past issue of QST or other radio magazine, I'd appreciate any references.

I'm interested in how to evaluate filters for insertion loss using it's relationship to SWR. That is, if I measure the SWR of a properly terminated filter, can I calculate the insertion loss of the filter?

Thanks for your help.

As far as I know, the only U.S. manufacturer to produce a big wheel was Cushcraft, and that was decades ago. You can find some information on it in "The Radio Amateur's V.H.F. Manual" by Ed Tilton, W1HDQ. My version (the first edition) was published by the ARRL in 1965. It carries an ad from Cushcraft showing, among others, a big wheel. On Page 214, under the section titled "Omnidirectional 144-Mc. Antennas", there is a fairly long piece on "The Big Wheel".

More recently, Dave Clingerman (W6OAL) of the "Olde Antenna Lab", 4725 W. Quincy Avenue, Denver CO 80236 phone (303) 798-5926 in 1995 quoted me a price of $400 plus shipping for a 6m Big Wheel.

Hope this helps.

Gee, I have been using 'hot glue' for gluing down small toroids in HF
applications, and never thought about RF losses. Thanks for giving me,
one - something else to worry about, and two - something else to brainstorm.

Will the projects never end?

It's not a prescaler, it's an ECL binary counter, so it would be in
the MECL databook. Their prescalers are in the MC12xxx number range
and (I think) are in the Communications databook (or web page section).

Source record: 70020

FS B & K model 600 Grid Dip Meter and full coil pack. This meter is collecter quality, Coils are in original B&W box. This is the bullet shape meter with tuning knob on front and meter on left side. Has a piece of yellow tape
near top above meter with small scratch in corner of tape. Has very small scratch (less than 1/16 inch) above 90 to 100 mhz on outer edge of dial in pink section for coil 600-A-5. Coil pack is in original B&W box which is perfect. Yellow (600-A-3 14-36 mhz) coil has a few scratches and White (600-A-3 5-14 mhz) coil has 2 small (less than 1/8 inch) scratches on it. Thats it! otherwise perfect as when it came from B&K years ago Serial number 3384 Works great! Reason for selling is I use it and want to buy a MFJ-259B to replace it. Make an offer. No reasonable offer refused.

Ah yes, the free power radio ... takes me back a few. If you are near a transmitter and can erect an efficient antenna, these work well. I used a long wire antenna (about 80 feet) in Pittsburgh, PA years ago. It was loud enough that my parents could hear it at night from their bedroom and they (needless to say) were not as enthralled with the project as I was. By the way, bigger loudspeakers tend to be more efficient.

Rectify (germanium/Schottky diodes work better) and filter the output of a tuned antenna circuit to power a one transistor amplifier. You can use a second tuned circuit to select another station to be detected and amplified.

If you can find older magazines, you can perhaps dig up a schematic. Good Luck!

Doug,

Duco Cement is not realy good for holding down Torroids you would be better off getting a tube of DAP bathroom caulk and putting a little under the coil ond pressing it into place. RTV (Silicone Adhesive) works well too.

JF1OZL's Web page (do a search on his callsign) has a bunch of - shall we say "exotic"? - circuits, I'll bet he's got one to do what you're looking for here.

Once you get it working, take a look at his voice-powered transmitter. You could build a full two-way radio with no batteries, commercial power, or solar cells...

RTV, including silicone bathroom caulk, is corrosive during the curing process - not good for copper wire used in toroids. There is an "electronic grade" RTV which is not corrosive.

What is "PVC glue"? If you are referring to the stuff used to join PVC pipes together, to the best of my knowledge, that's a solvent, not a glue. It bonds pipes together by dissolving the PVC, allowing the pipes to chemically "weld" together.

I'm not certain what the original poster's "VFO tank coil in my Ten-Tec transceiver" looks like, but I would be concerned that a solvent might damage the enamel on the coil windings or damage the coil form.

At the very least, I wouldn't depend on the structural integrity of dried solvent. There are probably better materials to use.

Just my .02 worth...
Pete

INFO:

For all those asking about my 2Mtr Preamp using the
3SK124 GaAsFET....this device is no longer produced
in the "pill" package.

The NE25339/3SK206 is a very close substitute but now
in Surface mount only. The board layout will need
to change for the device.

A new 3sk206.dat file can be generated using the
MAKDAT4.EXE utility that comes with the ASP 4.0
Preamp Freeware program.

Order the 40 - 80mA IDss for best NF, IP3 results.

Hello

Here is a page that I found from Motorola. The spec sheets on all their RF transistor include test circuit schematics to test to 30 mhz and beyond. You'll need a PDF file reader. (Acrobat is the only reader that I know of that will display these properly). If you don't have Acrobat, just do a lycos search on it and you will find many sites that you can download it from.
Take time to look through all the sheets, there are about 100 or so, all of them are RF related.

The address is:
http://mot2.mot-sps.com/books/html/dl110_index.html
or
http://mot2.mot-sps.com/rf/dslist/list.html#MRF

Hope this helps

Hi,
I saw a site (sorry, but don't remember URL) with lots of German crystal
radios from 1930 and up.
One of the schematics presented two detectors (may be two tuned
circuits too), one was used to rectify and feed a germanium transistor
amplifier which amplifies the signal one must hear.

When I was a kid and didn't know anything about impedance matching, I
made a small crystal radio using a loudspeaker connected directly to the
output.(no amplifier)
I lived in Rio de Janeiro, 1Km apart of a broadcast station (820Khz -
Radio Ministerio da Educacao e Cultura) and every morning I waked up
with this radio, listening a gymnastic program, very loud.

My antenna was the refrigerator body and there was a connection to the
ground. The radio stayed in the kitchen and could be heard
more than 4m (13ft) apart.

Cheers.

>>for these types of filters.
>>
>>Mike
>>
I've tested 1/4, 1/2, 3/4-wave notch filters - what you choose depends
on the prupose. Second harmonic filter is 1/2-wave on the undesired
frequency

Tried some 2m repeater filter improvement, 600kHz between RX and TX,
3/4 wave configuration with 2.2pF series capacitors. Result 12-15dB
notch, but you must use some extra stubs to optimize impedance for
minimum loss. 12-15dB is not much, it is low, and result of the small
coupling capacitor or 2.2pF.

In an ordinary quarterwave band notch filter you achieve easily 40dB
with a single tuned circuit, and possibly 90-100dB with two tuned
circuits. It is very wide, the series capacitor is used to build a
narrower filter, but has not so much attenuation, the larger capacitor
the deeper notch, but also broader. The coax-stub is inductive on the
frequency you operate, and it is tuned with a tapped trimming
capacitor 1/3-1/5 from the shorted side.

believe the velocity factor for 7/8" heliax(hardline) is 0.82,
cellflex is somewhat higher, possibly 0.9

Quite frequently simple quarterwave filter is a nuissance because it
attennuates every odd harmonic above first resonnance, a 3/4-wave
filter is even worse. This calls for LC-filters. Made a two-section
filter for 2m with 45dB attenuation.
LC notch-filters are particularly important to use for 50MHz, but
because of ch.2 tx in neighbourhood I cannot transmit on 6m

BW antennas are popular mainly for beacons. Bought a 2m BW in Germany
for mobile operation, but driving in 100mph with a BW isn't too
practical and it reduces miles per gallon considerably, so I now stick
to the the old J-beam halo aerial with 6dB lower gain - was available
for on 2.50 UK pounds 25 years ago

I was worried about RTV -- I've got plenty of it, but had been told it was bad news for use on connectors due to corrosive gases released during curing. Figured it'd be even worse on toroids. Ten-Tec does suggest hot-melt glue as an alternative. I don't do much wood work so didn't think it'd be worth my while to buy a glue gun for one coil...

So far the Duco seems to be doing the trick. (of course, it's only been there for a few hours!)

Thanks to everyone else for the interesting replies! (I'd feel better if there were a consesus to the right thing to use<G>)

I have no experience of trying this, but.... wouldn't it be better to
use an _untuned_ feed to the power rectifier? That way, you get
power from _all_ the transmitters the antenna can receive, not just
one....

Way cool if you can make it work.

Would appreciate receiving a copy of the manual for what I believe is a HyGain
6 Meter Halo antenna. The parts and stamped aluminum brackets have all the HyGain earmarks. Called Ron at MFJ and they have not sorted out all the documentation on their new line of recently purchased antenna products that used to be HYGain. The antenna has two alum. rings with gamma rods at each end facing the rings and supported by the delrin connector at one center point.
The opposite delrin connector looks like the feed point, with two alum. L brackets and a cross pc. of alum. stock about 1 inch long. Not sure that these
L bkt pcs and cross pc are really part of the product or got added on by someone along the way. The way they were mounted when I got the antenna, would present a short across the feed. Another way to describe the antenna is
two rings stacked on top of each other with the delrin insulators at 0 and 180
degrees . Two gamma rods on the 180 point and the alum. bkts on the 0 side. Would be fun to get it going with my 706 in the car. Thanks for your time in trying to help.

FS B & K model 600 Grid Dip Meter and full coil pack. This meter is collecter quality, Coils are in original B&W box. This is the bullet shape meter with tuning knob on front and meter on left side. Has a piece of yellow tape
near top above meter with small scratch in corner of tape. Has very small scratch (less than 1/16 inch) above 90 to 100 mhz on outer edge of dial in pink section for coil 600-A-5. Coil pack is in original B&W box which is perfect. Yellow (600-A-3 14-36 mhz) coil has a few scratches and White (600-A-3 5-14 mhz) coil has 2 small (less than 1/8 inch) scratches on it. Thats it! otherwise perfect as when it came from B&K years ago Serial number 3384 Works great! Reason for selling is I use it and want to buy a MFJ-259B to replace it. Make an offer. No reasonable offer refused.

Monochrome TV is refered to as a black and white broadcast. Black
is the absence of light, and the white is a high intensity of light
given off from the CRT.

The true defination of a monochrome CRT, is one with a single gun or
channel. You can have a single gun CRT with green or orange phosphor
as in the older computer monochrome screens.

> Monochrome would imply. Heck, even Black and White is two
colo(u)rs.

"Monochrome" refers to the CRT having a single electron-beam gun and
a single-color phosphor on the CRT's screen.

Mono = single.

Depending upon the CRT's grid voltage, the beam+phosphor can create
dozens
and dozens shades of grey.

+AD4-If hot glue is polyethylene it should have low loss
+AD4-and a low dielectric constant.

Mike and all,

Most hot-melt glues are a mixture of amorphous polypropylene and some tackifier resins. The RF loss properties are almost as good as polyethylene.

Polyethylene hot-melt glues are available but they require temperatures above those of home glue guns. I remember seeing a company that sold emergency connector kits. These consisted of a large collection of different pins and sockets of all sizes. These were fitted to the existing connector and the wires were attached. A form was placed around this and molten polyethylene from a high temperature glue gun was squirted in. It did a wonderful job making connectors to weird military plugs and jacks. I tried using polyethylene in my home glue gun and wound up destroying it. These generally are thermal limited for safety and my gun got hot enough to soften the polyethylene and plug the gun up+ACE-

Roy Lewellyn made some Q measurements on some toroids a while back trying to determine the effect of coatings. A few of the poor materials gave low Q, but most good dielectrics had little effect on the coil Q. Some good ones were: polyethylene, polypropylene hot melt, RTV silicones (after curing), polystyrene, and paraffin wax (not beeswax). The wax is especially nice when experimenting as it is so easy to remove. Cyanoacrylate (super glue), RTV and epoxies do OK for permanent installations.

As someone else pointed out, most common RTV (room temperature vulcanized) silicone sealers release acetic acid when curing. These have a strong vinegar smell, and they can corrode nearby materials. There are silicone materials that do not release acid when curing. I believe GE makes one version in their professional builder's supply line. Read the label carefully to make sure you have the right one.

This combination is used in some glue sticks. They tend to be be somewhat "sticky" at room temperature. The glue sticks that look like RG-8 center dielectric are generally amorphous polypropylene and tackifier resins.

The material using polyvinyl acetate is not a good dielectric, while that using the polypropylene is.

Thanks for mentioning this.

Good explanation, Barry. Thanks.

For home use, at HF frequencies, I think I'll stick with the 'high
temperature, home type glue'.

Unless I come across a commercial type.

Thanks for your time.

Yes, but the '016 series is a fully *synchronous* counter. As far
as the output stability is concerned, the BCD output should be valid
for 1/2 to 2/3 of the clock period at 1 GHz. Typical prop delay
is about 1/3 of a nsec.

Living over on the border between the two real states of Tennessee, eh. [I
am in Kingsport.]

Duco cement is cellulose nitrate with plasticizer. It will work OK. For a
lower loss coil dope, get a small glass bottle and fill it 3/4 full of
acetone. Stuff in as many stryfoam peanuts as it will hold.
Then let it sit for a week or so for all the "fuzzballs" to dissolve. The
resulting glue will have about as low an RF loss as is possible.

5374. Need design for amplified crystal radio - Drive small speaker, with no battery

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-24 00:00:00 UTC
From: swabbie@hotmail.com
Message-ID: <a1523.948$%l6.7075799@rsnws01.mn.mediaone.net>
Source record: 70026
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew,sci.electronics.components

Along time ago, I saw a crystal radio with no external power that drove a small speaker, like that in a PC computer. It wasn't very loud, but all you needed in a quiet room. There was some sort of a transistor that was used as an amplifier, powered by the stray RF from the antenna. It was a very cool way to hear the local AM station.

I'm guessing that someone here knows where I can find info and maybe even a print for such a crystal radio, that can power a small loud speaker with no external power. (other than that brought in on the long wire)

Thanks for your reply.

: >John
:
: Try connecting a Motorola 10EP016 as a divide by 10 using feedback
: gates. It should easily do 1 GHz and put out BCD.

While you can easily get a divide by 10 functionality from a 4 bit
counter with asynchronous (ripple) reset at count of ten with some
external gates, the problem is how to get a stable output from a
BCD/1-of-10 decoder, since the BCD produced by the counter is stable
for much less than the clock period when operating near the upper
frequency limit of counter, especially if the counter is an
asynchronous (ripple) counter.

A synchronous counter with synchronous counting and synchronous reset
requires 4 JK-flip-flops, two 2 input and one 3 input NOR gate would
generate a cleaner BCD count suitable for BCD/1-of-10 decoding.

One trick that was used in the CMOS family in the early 1970's, when
CMOS was considered a slow logic, was the Johnson counter, which is
essentially a 5 stage shift register with the output cross coupled to
the input. With ten 2 input gates all ten states can be cleanly
decoded, but this counter does not produce a BCD value, so it is _not_
very practical for using in e.g. frequency counters to drive a 7
segment display (trough a latch), but very easy to use, if you require
some 1-of-10 output(s).

Hello all,
I found a certain number of military transmitting tubes and
I also found a little manual (just four pages) with the tube's
description. Unfortunately I don't read the russian so I'd
appreciate if someone could translate this manual to english.
I scanned the manual and put it at the following addresses:
http://sirius.ccii.unipi.it/~iw8qpi/scan1.tgz (34K very poor quality)
http://sirius.ccii.unipi.it/~iw8qpi/scan2.tgz (250K poor quality)

If someone is interested in actually translating this manual I'll send
photocopies. Also I'm interested in selling some of those tubes if
someone wants them.
Please contact me by email: frank @ ing.unipi.it (remove spaces).

I remember one design of such kind by:
grow crystals to make a big crystal speaker.
The crystal is the same used by ear plugs.
May be is it available if you try to find peizo crystals and make a
speaker out of it.
The RF signal have to be stepup by a transformer.

Regards

K.T.Chan

I just got a 1936 magazine with an article for a portable
low-power10-meter rig -- THAT would be a challenge (as it probably was
then)! Just finding 60-year-old parts might take it out of the
"quickie" category, though.

Hello,
I saw some hidden radio's handbuilt inside phones and such
to hide them when I was in Norway. It occurs to me that these
must have been very simple devices. Does anyone know a
good book on basic radio construction. I would like to learn more
about the inner workings of a SIMPLE radio and thus a modern
kit is not really my interest. It would just transmit Morse code of
course, although a radio that received voice would be fun to build
too. I believe at that time they used something called "crystal sets"?
Detailed information is needed please. The radios I saw (used to
transmit and receive Morse) appeared to have very few parts so I
am hoping with the right knowledge it not too hard to build one.
Also, any band suggested for such a radio? Anyone know what bands
were used in WW2 for underground communication? All help
deeply appreciated.

VXO transmitter (all the usual references) + direct conversion
receiver (ditto).

The beauty of direct conversion is that very little of such
a receiver is frequency sensitive, so you can build it for
any band you like.

Was it one of those that used a single tube for both transmit and receiver? It would be a modulated LC oscillator on transmit and a superregen receiver on receive. They were apparently quite common in the old 56MHz band, and then (perhaps after higher standards were required there) the 112MHz band. And a similar scheme was shown in the 1968 ARRL handbook (probably other years too) for a 420MHz transceiver.

I've seen retrospective articles about that sort of transciever, and they said they helped to popularize the bands, moving up as the rules got stricter and the bands more crowded. I imagine that not all were used in portable operation, but their simplicity helped people to get on the bands at home. I guess in the same way that Gunnplexers have helped the 10GHz band, or the APX6 surplus transceivers helped the 1215MHz band years ago.

I guess my question about 10meters is whether the rig you saw is similarly simple? I don't recall seeing mention of such things on 10Meters.

Of course, the simple idea did live on, in the form of cheap 27MHz walkie talkies that sometimes were converted to 10Meters. They used a single transistor switched between transmit on receive, though they were crystal controlled on transmit but still a superregen receiver, and of course the separate audio chain.

Note particularly that experience from some years ago may not be valid now, because formulations do change.

>I'd try and select another RTV that avoids acetic acid.

On the whole, so would I, but I haven't found it as critical as Cliff has.

My present favorite is Dow Corning 744, which is non-acidic, non-slump, a tasteful shade of white, and reasonably priced for small quantities. It takes longer to set than some grades (more than 24h for full strength) but it also keeps well in the tube.

I would greatly appreciate if anyone has information on mobile phone
modifications/programing. Particularly Nokia 101 and Motorola 7500.
We are working on a project that requires mobile transmitters used for fault
alarms on remote industrial equipment and would like to be able to set up
various mobile phones as transmitters with the receiving mobile set up on
scan mode to monitor each of the transmitted alarm signals. The analog data
then will be fed into a computer for alarm trending.

Any help tips or references would be appreciated.

I'm only speculating (I'd like to hear some solid info myself) but a simple radio from that era would have been a single tube crystal-controlled transmitter (using perhaps a 6L6 or 6V6), and a regenerative receiver consisting of maybe a dual triode (detector and AF), or a pentode detector followed by one or two stages of triode AF; or perhaps a regenerative superhet using a converter followed by a dual triode detector and AF. An RF amp may also have been added to the bigger sets for better performance, and to help keep the Bad Guys from picking up the signal from the oscillating detector in the case of the regen. A crystal set wouldn't have had the range for such work, and more importantly it couldn't receive Morse (CW). I'm cross-posting this to the boatanchors group because they're likely to have lots of details.

Believe! I've seen schematics for this type of circuit, though I haven't tried it myself. If I remember correctly, the radio actually has two tuners. One tuner is set up to resonate on the station of interest. It is "detected" with a germanium diode and fed to a single transistor for amplification. The second tuner is tuned to as strong a local station as you can find. It's output is rectified with a couple of germanium diodes, and is used as the power supply for the amp.

I don't propose that the volume would be ear-splitting, and you'd still be better off using this type of radio with a set of headphones, but it is an interesting trick none the less.

Pete

Hello Ian,

Info is not of much use unless you tell us HOW to obtain some. I've already asked in Woolworths and they don't know what I'm talking about.

Reg, G4FGQ.

The cement (and the leads) are all that mount the toroid in this radio. (so without the cement, the thing is rather microphonic<g>.) I'm not worried about the Duco causing any problems for the form -- it's just a ferrite core. There hasn't been any damage to the enamel either; I'm not sure there would be any ill effects if it were lost. (I've never taken an ohmmeter to a ferrite core -- how conductive is it??)

My experience is like Ian's. I've used the acetic-acid curing RTV for over 20 years on all sorts of materials and have never seen any sign of corrosion.

For those who prefer non-acetic-acid-curing RTV, there's now a brand readily available in home-handyman type stores (here in the U.S. anyway). It's GE "Silicone II". I've found that it can sometimes take a long time (several days) to cure, but at least it smells nicer than the standard stuff.

I used to get them at a hardware store. I'd have to ask at a counter in one part of the store, they'd put them in an 8.5 by 11 (or whatever) inch envelope, and I'd take it to the cash to pay for it. The cashier would tear the envelope open, and then be puzzled by the apparent lack of anything in the envelope. Of course, the drill bits were small and I was buying a few at a time.

The chain went bankrupt and I never bothered checking other hardware stores.

In recent years, I've been buying those small drillbits at hobby shops. Those are fairly common, even where electronic stores aren't. The prices aren't the best, and I imagine you can get better quality bits elsewhere, but hobby shops are readily accessible.

They are also a great place to buy small diameter brass tubing, useful as spacers and easily tapped for various bits of hardware, as well as small bits of brass sheet. You might also be able to find copper tape there (it's used for making stained glass windows), and who knows what else.

(Sigh) Well, you have to take into consideration how much it would cost
doing it any other way. Then it doesn't cost so much.

The problem is not the solutions cost so much, it's the problems we chose
to tackle.

What advantage would a "mobile phone" have for your application ??

It would seem to me that if you are scanning in order to pick up
the transmission, that a mobile phone is not needed. Do you
want the mobile phone to actually dial a phone number when
a fault is detected ??

When you say mobile phone, do you in fact mean "Cellular Phone" ??

If not, then perhaps a Motorola R-Net data radio unit, or a
Varda alarm would better suit your purpose..

Kantronics also makes telemetery equipment based around their
packet radio controllers.

Just my $.02 :-)

Source record: 69970

Do you remember the HBR receivers that were designed by the late Ted Crosby, W6TC? There were several versions of these very popular homebrew receivers. The first was the HBR-14 published in the July 1957 QST, followed by the HBR-16 in the October 1959 QST, the HBR-8/11 in March/April 1963, the HBR-12 in April 1964, and the HBR-13 in the October 1965 QST. There were also many improvements and add-ons by others, Alexander Stewart, WA4ZNI and William McKay, W7QBR to name just a few.

Many HBRs were built, and there is presently a small group HBR enthusiasts who are interested in your stories about the HBR you anticipated building, built,
used, or currently use. We would like to know your perception of how well it performed, problems you had with construction, calibration, etc. We're also interested in hearing from those of you curently trying to locate an HBR or if you anticipate building one.

We would like to hear about any correspondence that you may have had with Mr. Crosby, Mr. Stewart or the authors of HBR related articles published in QST and other amateur publications. Also, don't forget Mr. Ed Kent, K8EML, he was the compiler of the original HBR Notes. Did you have any correspondence with him? Tell us about it!

If you are currently interested in building one of these fine receivers we invite you to network with us. There are no fees, we're just a group of HBR enthusiast that help each other locate and obtain the necessary parts, share construction hints, etc.

In summary, if you're an admirer of the HBR tube receivers, then we would like to hear from you.

> Can anyone out there help?

Tunable in that you want to cover different subcarriers, or different main channels?

There are only two subcarriers in use for TV; the SAP at 78.67117kHz (5 times horizontal sync) and the Professional Channel at 102.27252kHz. (6.5 times horizontal sync) Other subcarriers aren't exactly illegal, but there's no commercial equipment available to transmit or decode them..

I would visit http://members.aol.com/fmatlas. They sell tunable subcarrier modules for FM radio; these should work almost as well for TV. ("almost", because the SAP audio is DBX companded, something FM doesn't do. I don't know of any inexpensive DBX decoder circuits.)

Oh - OK. I just used it (the blue stuff) and it has a residue that
dries transparent and quite hard. Nothing terrible hapened to the
enamel of the wire. Most 'dope' is solvent with stuff ('styrene?)
disolved in it - but leaving plenty of free solvent.

I don't know how the toroid was mounted in the Ten-Tec, either.
I made a VFO and had to place it firmly on the board somehow.
and did it flat but spaced with the slice of cork. Could've
used a nylon screw or somesuch. Just Lazy, I guess.

I better not tell you what I used for a toroid! :-)

As for integrity - well, might depend on how rough you
treat the finished product. Mine withstands dropping, I know.

From: matteone@my-dejanews.com
Message-ID: <7ido3ifhr1@nnrp1.deja.com>
Source record: 69974

Hello all, I am quite new to the construction of antennas, but the thing excited me so much that I decided start to do something.

i started from the random lenght dipole, fed with a ladder line, attached to an antenna tuner (the PALSTAR AT300CN). As dipole branches I used some thiny copper wire. Now, the thing I am not sure about is the influence the plastic insulator that covers the wire can have on the antenna behaviour... maybe it behaves like a dielectric or what? Do the branches of a dipole always has to be naked copper and nothing else?

thanks in advance for the suggestions

On 24 May 1999 20:43:01 -0700, rick@area.com (Richard Karlquist)
wrote:

: Yes, but the '016 series is a fully *synchronous* counter.

Yes, I realised this, when I found the preliminary documentation for
the MC10EP016, which is an 8 bit counter, while the garden variety
10016 is a 4 bit counter.

: As far
: as the output stability is concerned, the BCD output should be valid
: for 1/2 to 2/3 of the clock period at 1 GHz. Typical prop delay
: is about 1/3 of a nsec.

You must have some better source of information that I found (Rev 0.1,
dated 05/1999), which only states typical propagation delays as 550 ps
at 25C, all the min/max values were listed as TBD and no rise and fall
times available :-). With an external gate to generate a true BCD
(0..9) sequence, the window for a stable count would be quite narrow
due to the propagation delay of the external gate and asynchronous
reset.

Anyway, the specifications for the EP016 are really impressive,
compared to the '016. The possibility to use it as an up to 16 bit
divide-by-N counter running at full clock speed using the internal TC
(terminal count) signal to preload the counter makes it very
interesting. Unfortunately, based on the price estimates for other
10EP series chips, this chip is going to be quite expensive.

At frequencies below 30 mhz the coating of the wire is not important. Either enamel or the plastic coatings will have almost no effect. As the frequency increases the coatings will have the effect of making the wire seem longer electrically than it is. The coating will not have any noticable effect as to the efficency of the antenna. For antennas I like the plastic coated wire as it helps keep the copper from turning green.

Source record: 69979

Hello Matteo,

A random length dipole, ie, not of any particular length, fed with ladder-line or open-wire feeder, is the best multi-band, general-purpose antenna there is. Best when dipole length is 1/3-wavelength or more at the lowest frequency of interest. At lower frequencies it can be used as a T antenna.

Wire diameter is of no importance except that the wire be strong enough to withstand suspension stress and high winds.

The effect of thick plastic insulation on the dipole wire is to very slightly increase the capacitance of the wire to its surroundings. The antenna behaves as if the dipole length is 1 or 2 percent longer than it actually is. No extra power loss is caused.

So the electrical effect of plastic insulation on a random-length antenna is ZERO.

Even on a resonant antenna, where length matters, a change in effective length of 1 or 2 percent is usually of negligible consequence.

A disadvantage of plastic covering - it increases the weight and tension. Enamelled copper wire provides protection from acid rain, etc, without increasing weight. I use nothing else.

To analyse performance of ANY dipole with ANY length of feeder, down-load program DIPOLE1 from my website. Takes only a few seconds. Not zipped-up. Can be run immediately.

In practice, the vinegar-smelling silicone rubbers don't seem to corrode clean, dry copper (or even copper that is partly tinned with solder). The toroid and enameled wire are not at any risk either. Try it and see for yourself!

You have to try it anyway, because formulations will vary between manufacturers, and even with the same manufacturer and brand name the formulation can vary from year to year, or in different countries.

>Ten-Tec does suggest
>hot-melt glue as an alternative. I don't do much wood work so didn't think
>it'd be worth my while to buy a glue gun for one coil...

Once you've bought one, you'll wonder how you ever managed without it. Don't think of it as glue, more as an instant source of moldable plastic. You can also re-work and sculpt the material with a clean (preferably new) soldering iron bit, a hot-air gun, or a hot-blow tip on a butane soldering iron.

As Barry has already noted, the ordinary sticks that look like the inner of RG213 (polypropylene) have excellent RF properties. It's particularly good for sealing ends of coax that are exposed to the weather.

I have a datasheet at home, 8 pages, including test circuits and
applications information. If you (or anyone else) wants, I will scan them.

Windows is said to be simple and easy to learn. That's right. It was
always simple to get that funny blue screen. And it was very easy to
learn that there are much, much better OSes.

Yes it is.All you need is an Amateur Transceiver and some duct
tape.Attatch the scanner to the AT with the tape.Leave the scanner
switched off and use the AT.

Not very easily. You could modify a VW Bug into a Ferrari, but would you really want to? The very fact that you ask leads me to believe you don't have the technical background to build your own FM transmitter, which is what you'd have to do. (Please don't take offense, I don't have that kind of skill either! My skill level with homebrew electronics falls somewhere between dumb and dangerous. <g>)

The thing to do is go out and get yourself a *real* Amateur HT. Most if not all of them have receive-only coverage that is the same, or in some cases better, than a scanner. Plus, you won't have to deal with the expense and hassle of building your own.

You can ONLY receive MCW on a crystal set or the OLD raspy spark
transmitters. A pure CW signal MUST have a BFO to beat with the carrier to
produce a tone. Of course you could copy the thumpity thump thump carrier.

Well, you will probably have to use germanium transistors because the supply voltage from the antenna's rectified RF is very low, only a few hundred millivolts. In any case, use some solar cells and run it in the light.

I built a crystal radio that worked great, but then there was an AM transmitter only a few miles down the road. :O)

Is it possible to modify my lunchbox to transmit on Commercial
frequencies? :)
ANYTHING is possible. Sure a scanner can be modified to transmit on any
freq. you want, you just have to add a transmitter.
Same goes for my lunchbox! (and a reciever)

All in good fun. People learn more when they are laughing.

I am positive that at least one was 2 way because there was a story with
it that indicated as such. Tube wise I could be wrong-maybe it had tubes.
So you're saying there was no way to build a 2 way radio without tubes
(back then)? Any idea on the simplest possible way to build a 2 way radio
then or now? I know I could buy a kit but I thought it would be more
instructive to
scrounge parts so I would need a good book on the topic I guess.
Any ideas on a reference that details building simple CW transceivers
from the fewest possible parts? I am not looking for DX performance here-
no bells or whistles needed. This is for my education and if I can build 2
units to
send CW back and forth over short distances for practice I would be
one happy ham. Also, if anyone has a source on the behind the lines use
of radio (detailed) in WW2 I would appreciate that. I doubt there are too
many WW2 radio officers browsing the web these days. Too bad-would
be a wealth of information.

>although they might be sold under one or more other brand names, or
>through another company.

You'd be surprised how tiny a presence GE have in the UK - especially compared with the USA where they seem to be into everything.

Yes, they do license some products, but there is still no guarantee that they will be the same as you'd buy in the USA. Sometimes the same product is available under a different brand name; sometimes only the brand name is licensed, but then applied to a different product.

>It might be worthwhile to check with a
>home-handyman or hardware store to see if a non-acetic-acid type RTV
>is now available at home-handyman or hardware stores.

Even the term "RTV" is not used over here - we call it silicone rubber. You can tell the acetoxy type from the label, which usually mentions the vinegar smell, but non-acetoxy types aren't always identified as such, and may not even be silicone - they may be an acrylic formulation instead.

That's why I've been driven to paying extra for an industrial-grade product, because at least you know what you're getting.

Assortments of such bits are often sold by surplus dealers (*). Commercial PWB houses generally do not sharpen the carbide bits, but even when they do, they stop when the bit gets too short for stacked boards. Thus many appear surplus.

The only problem with carbide bits is that you cannot use them in a hand-held drill. They really need an accurate drill press. Any side torque and they snap as the carbide is extremely brittle.

With glass/epoxy boards, ordinary steel bits only last a few holes. A carbide bit will last many orders of magnitude longer.

73, Barry L. Ornitz WA4VZQ ornitz@dpnet.net

(*) I think Alltronics has carried them in the past.

Unfortunately Motorola seem to have removed a lot of stuff recently.
There is no sign of eg the MRF421 or 317.

http://www.zettweb.com/ has a Motorola databook CD online from
sometime last year which still has data on these devices.

Hi Mike,
Why couldn't you receieve CW on a crystal set? Not enough energy
in the signal I assume? I saw these homemade rigs at the Resistance
Museum in Norway about 7 years ago, which was before I was a ham
so I wasn't paying enough attention. They were VERY basic and not
commercial rigs at all. Basically they amounted to the simplest
possible equipment you could make to send and receive a signal, which
is why I find them interesting. As I recall they had 2 or 3 examples, all
very small. I do not remember seeing tubes, although it was a while ago
and it could just be my bad memory.
Thanks for your post,
Eric

It's an industrial-grade material, not a domestic or DIY product.

For anything like that in the UK, I generally go to Farnell. (Maplin doesn't have it. RS might, but it annoys me, the way they like to pretend that everything is their own brand.)

The DC 744 is Farnell stock no. 521-838, ï¿½9.28 + VAT for a standard 310 ml cartridge. Not cheap, but it's good stuff and will last a long time after the cartridge has been un-sealed.

Just to illustrate international differences, GE "Silicone II" does not exist in the UK - because there's no GE.

Ferrites vary - some will give a reading if the probes are only
a cm. or so apart with the meter on hi-ohms range. Sometimes
you can match materials this way.

From Jack:

What are the advantages and disadvantages of using PWM (buck/boost or invert) switching supplies for B+/C- etc in tube equipment, boat anchors.

Advantages: weight, efficiency, regulation, low ripple.

Disadvantages: RFI

I mean, why shouldn't one buy that J.Millen GDO if you can run it without having to be attached to the line cord?

What else am I missing?

5443. MRF421 amp questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-26 00:00:00 UTC
From: Hamish Moffatt <hamish@rising.com.au>
Message-ID: <7iguh8leq1@arachne.labyrinth.net.au>
Source record: 69921

I have a pair of MRF421 BJT RF amp transistors with which I want to
build a linear amp for 6m. Two questions:

Firstly, can anyone point me at a circuit on the web or in a past
magazine for such an amp using two transistors? The stuff I've found
on the web (eg www.6mt.com) is all single-transistor stuff. I'd prefer
to use both if practical.

Secondly, the 421 is intended for use up to 30MHz, so the datasheet
doesn't give any output impedance figures for higher frequencies. Is
there a relatively straightforward way to measure it? How will the use
of two transistors change the output impedance matching network?

Thanks
Hamish VK3SB

: Nope.

Well -- the correct answer is always: "It depends."

One of the regional state highway patrol freqs is at 154.905 mcs.
So, I get to hear a lot of "tweep-tweep-tweep" QRM between
144.200 and 144.205 mcs.
Granted, this is not a "modification" to xmit on amateur freqs.
Oh No, it works that-a-way right out of the box.

Hi Andrea:

The MC3362P pin out is as follows:

pin 1 - 1st mixer input pin 24 - 1st mixer output
pin 2 - LO output pin 23 - varicap control
pin 3 - LO emitter pin 22 - 1st LO tank
pin 4 - LO base pin 21 - 1st LO tank
pin 5 - 2nd mixer output pin 20 - 1st LO output
pin 6 - Vcc pin 19 - 1st mixer output
pin 7 - limiter input pin 18 - 2nd mixer input
pin 8 - limiter decoupling pin 17 - 2nd mixer input
pin 9 - limiter decoupling pin 16 - Vee
pin 10 - meter drive pin 15 - comparator output
pin 11 - carrier detect pin 14 - comparator input
pin 12 - quadrature coil pin 13 - detector output

This information is from the an older Motorola Linear and
interface data book.
Hope this is of use.

Michael Gladu

Nope. The TDA7000 maxes out at about 120 MHz.

Either put a downconverter in front of it, or use
one of the newer IF chips (try Motorola - anybody?).

The new IF chips can be a handful; a downconverter
followed by something like a TDA7000 could be a lot
easier to make work. YMMV.

GE (General Electric) is a huge, multinational company. So I suspect that a large number of their products are available in the U.K., although they might be sold under one or more other brand names, or through another company. It might be worthwhile to check with a home-handyman or hardware store to see if a non-acetic-acid type RTV is now available at home-handyman or hardware stores.

(Then again, it might not be. Speaking of international differences, I recall trying to buy some isopropyl alcohol at a chemist's in Australia some years back. I was told -- after some difficulty in translation -- that it couldn't be sold because it was used in the manufacture of some illicit drug, and I had to settle for denatured alcohol -- "methylated spirit". In the U.S., isopropyl alcohol can be readily found in any drug or discount store. For that matter, illicit drugs can be found about anywhere, too. But then, Vegemite is awfully hard to find in the U.S. . .)

Even with switching supplies (which you'll have to build or buy), the tube-type GDO will take a whole lot more power than a solid-state equivalent. So the battery will be bigger and heavier, and/or won't last as long. This probably isn't a problem if you're working on the ground, but could be a real pain if you're on a tower or ladder.

But I don't know if there is a solid-state equivalent available these days. If not, there may be a reason. The information you got from a dipper can usually be gotten from other instruments, and in more quantitative form. But the exercise of building switching supplies to run a Millen will certainly be an educational experience with value much greater than any information you get from the dipper itself.

You need some kind of heterodyne action to extract an audible signal from a CW signal. In a superhet the heterodyne action comes from the beat frequency oscillator; in a regen detector it's the detector itself oscillating; in a direct conversion receiver it's the local oscillator. A crystal set would just demodulate the unmodulated carrier and you'd only hear "psss..psssssss..psss..psss...". Crystal sets were used (e.g. the foxhole radios) to receive broadcasts, but a two-way radio of the time would have had tubes. Are you positive they were two-way sets?

> product, because at least you know what you're getting.

A wise approach. Incidentally, I believe that "RTV" is a trademark here in the U.S. so it's used in trade only by the company which owns it. Like many other successful trademarks (e.g. Nylon, Teflon, Kleenex, NiCad), though, it has come into popular use for the generic material. I have three tubes of "RTV" (none bearing that trademark). The GE ones are marked "Silicone II/Clear/Household Glue & Seal/Advanced 100% Silicone Rubber" and "Silicone II/White/Bathroom Tub & Tile Sealant/Advanced 100% Silicone Rubber", and the other one I have is DAP brand by Dow Corning, marked "Silicone/100% Silicone Sealant/Clear". This last one is the acetic-acid type and mentions that in the fine print on the back. The fine print on the GE products announce that they release ammonia (and cautions you to remove contact lenses while it's curing!). So it appears that the labels of these products reveal that they're silicone rubber and whether they're the acetic-acid variety. It's unfortunate that the contents aren't as clearly stated in the U.K., but given that they aren't, your approach is the only prudent one. Barry Ornitz has pointed out that "RTV" formulations vary a great deal among brands and among products within a brand, so for critical applications, an industrial product would be a much better choice here also.

When I was a Child I had a Radio Shack "150-in-1" Project kit (The "spring and wire" type affair) and guess what? One of the projects was to build this type of receiver!

As I recall the volume was miniscule which proved that "you don't get something for nothing" and it only really worked on local stations with a long wire antenna.

Unfortunately, the kit has long since gone, so I'm unsure of the exact schematic. If anything springs to mind I'll let you know!

No, not if you mean a scanning *receiver.* You would have to add the entire transmitting section, which would be a project for someone highly skilled in radio design, and hardly worth the effort.

Hi, I need a 10Kohm 2w pot (1/4" shaft) for the RF gain control on my NC-183D. Such beasts are no longer standard stock and I'm having problems finding one. Anybody have one they could sell me? I have *many* others with different values to trade or will buy...thanks!! 73, Chris

Neat! Cool! I was right, the transistors should be germanium because the supply voltage is so low. I've made amplifiers that run off 1.5V, so it's not difficult. The only problem I see is where to find the transformers for the last circuit.

Most people have earphones from walkman radios, so it's not a problem to drive them directly since they're about 10 to 50 ohms impedance. But the rest of the circuit has to work on probably less than 1 volt if it's not extremely close to a transmitter.

On another note, has anyone 'harvested' any other source of power? Like some people say they have been able to get power from high voltage lines by running a line parallel to them. Not that this is always possible, but it's a nice thought. Regarding above, I did not mean solar (PV) power. However let us know if you've had success with others, like wind, etc.

If I were going to build a simplest-possible useable tube CW transceiver I'd use a single tube crystal controlled transmitter (6AG7, 6V6, 6L6, 6CL6, 6AQ5, etc), and a dual triode regen receiver (6SN7, 12AU7, 6CG7, etc), or perhaps use a triode-pentode (6U8, 6EA8, etc). Any ARRL handbook from the '40s to late '50s should have both a single tube transmitter and a dual triode or triode-pentode regen receiver, but if you can't find any plans I can send you some.

If you stick a piece of tin and a piece of copper in a lemon, you'll get a
battery. It's low current and low voltage (you could put some lemons in
series), but it is a (very low) power source. In recent years, you've been
able to buy LCD clocks intended to run off something like this, sold in
science stores, and the one I saw live was run off a potato.

When I was a kid, I'm sure I saw in an encyclopedia something about making
a power source that ran off a candle. Twist two dissimlar metals together
and put it over a flame. I thought it was practical how-to instructions.
Might have been the World Book Encyclopedia, and it would have been the

early 70's. But I can't be sure I saw it there, or that I actually saw such a thing.

Take a little motor, such as taken out of a Walkman, add a propellor, and put it in the wind. It will generate some voltage and some current, though it will stop if the wind stops blowing, and the right kind of propellor, I know that's not the right word but the proper word escapes me at the moment, determins how well it works.

Thermocouple power sources are very interesting. In Russia, they made an
oil lamp with a thermocouple array in the chimney that gave enough
output to run a table radio.

Even high-output thermojunctions, such as copper-constantan or Chromel-
Alumel, only give about 40 uV per degree celsius. But the source
resistance can be very low indeed, if thick wires are used, so
significant power can be drawn. For example, at 400 degrees celsius, a
100 junction, 1 ohm thermocouple array gives 1.6 V and 1.6 A.

Hi,

I trying to find if the company that made enclosures under the name York or York metal works or something similar still exists. These enclosures were commonly used in the 70's for electronic projects. I am trying to restore several pieces of equipment that uses them. They are green color, marble type texture to them, about 18x10x10 inches (although they came in many different sizes). If you could even tell me what the exact name of the company is that would be great.

thanks for any help
steve

I actually just got a 10-megabit link up and running this past weekend
with the 100 mW diodes and MA/COM Gunnplexers from
http://www.shfmicro.com. The 100 mW diodes are about US $50 apiece.
Alan at shfmicro was very helpful when I had questions about the parts
-- you might give them a try.

100 mW is more than you would need for casual experimentation, so you'd
probably want to start out with the low-cost 10 GHz Gunnplexers they
sell for US $22 each. I don't have any experience with the low-cost
model but they should be fine for most non-critical purposes.

Uh...not to quibble but, "scanners" are...uh...scanning RECIEVERS. I suppose it would be sorta feasable to boost the local oscilator power up somewhat, and sorta use it as a transmitter that way, but I don't know why you'd wanna do that.

Don't wanna sound snippy, but I think I misunderstood your question.

Thanks, people.

John L., it that you?

Mouser has quite a collection of miniature and sub-mini transformers,
the kind that were so common in the old '60s transistor projects.

Jeff:

It's really not to difficult to accomplish what you desired in your post. The answer is, certainly, yes. You need to pull out of the scanner all the proper LOs (local oscillators), mix them in the proper order (using doubly balanced mixers), and modulate the final result with the type of modulation and information you desire. You're there! You may prefer to apply a little amplification to the result to render the "signal" a bit stronger, but that isn't too difficult, either, in these days of MMICs and hybrids. Trivial!

Modern multi-layer ceramic capacitors should work wherever micas were used. In applications where temperature coefficient is critical, such as VFO tank circuits, use NPO (C0G) capacitors. For other applications, type X7R or similar ("temperature stable") should be fine. I wouldn't recommend Z5U, Y5V, or similar capacitors as mica replacements due to their high temperature coefficient and other undesirable properties. They're excellent for bypasses or coupling capacitors because of their small size and therefore low inductance, but shouldn't be used for much else.

Many years ago, I tried to make a "super ground" reference by burying
several metal objects several meters apart and connecting them all together.
Before I connected them I tried to measure the resistance between each wire,
and found both DC and AC voltages between them all.
I cant remember the values, (I think it might have been over a volt) so
there must be quite a bit of current flowing around our globe.

I've seen designs that were effectively 2 radios in one. One was a
crystal
set tuned to a strong local station. The output was rectified and
filtered to provide power to a second radio that was a crystal
set with amplifier stages. I don't have any specifics but I do recall
having seen construction projects for such radios in the hobby
electronics magazines years ago.

Hammond Manufacturing in Guelph, Ontario, Canada still supplies
cabinets. They have a web site with all the info on it. Also, several
distributors still handle Bud Cabinets that may be used. Try Newark or
Allied Electronics for those.

<snip>

Hello--
IIRC, "RTV" is an acronym for "room-temperature vulcanizing" and refers to the process by which the silicone rubber "cures" form a goo into a solid or semisolid. Some formulations use acetic acid (smells like vinegar) and some use another noncorrosive agent (smells a little like peppermint) to promote the cure.

Hobby stores carry a drill index which contains bits ranging down to 18 mils or so. I think they are High Speed Steel so they probably will wear out quickly in fiberglass. If you are in an area with a lot of PCB houses, your local surplus store might also sell them. For instance, the AxMan in the Minneapolis/St Paul area sells a good variety of used bits. Minnesota is a state that ranks, if I remember correctly, third in the nation for PCB houses. Illinois is #2, California #1.

If you mean the old-style tube sockets (used for tubes like the "80")
try Antique Electronic Supply. I know for certain they have ceramic
4-pin sockets, as I recently purchased some. The probably have wafer
types as well. You will find them on the web.

If you meant some other type of 4-pin socket, you really need to be more
specific when making a request for help.

I'm new to homebrew radios. I'm building a tube style receiver that I found in the 1967 ARRL handbook and several different transmitters from early '60's QST's. All the pF caps are spect as siver mica. I can find these caps at several different suppliers but some times, particularly when prototyping, it would be nice if I could just run down to my local electronic supply store and buy the cap I need. They don't carry SM caps but I was wondering if a more readily obtainable equivelant exist.

thanks

How about a 1-tube (or transistor) regen receiver, with a telegraph key to throw it into full oscillation for transmit? Essentially, on transmit it'd be an Armstrong oscillator. Would have terrible frequency stability and probably a lousy chirp, but it'd be very minimal in parts and if you kept the power very low no one else would hear it to complain :-)

From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01bea9b3$e38f1dc0$abcaac3e@default>
Source record: 69788

Mica capacitors were used even in the very early days of radio equipment wherever high voltage, high HF current carrying capacitors were needed. For example in valve/tube transmitter output circuits.

Mica is a laminated rock formed many millions of years ago. Consequently its dimensions are very stable and will withstand high temperatures. Mica dielectric capacitors are very stable, are suitable for LC oscillator and precision filter circuits, and have fairly low dielectric loss.

They are still manufactured for use in high stability circuits. The capacitor plates are no longer copper sheets but the thin mica plates are silver plated on one side. They are described in manufacturers' catalogues as "silver mica capacitors" and are more expensive than the plastic-insulated types.

Silver plated mica capacitors, for obvious reasons, do not have the same current-carrying capacity as the older mica-plus-copper-sheet capacitors but have the same high working voltages.

So for high-power transmitting purposes look for THICK copper or brass-strip capacitor leads, OR use several capacitors in parallel, eg, 4 times 25 equals 100 pF, when high current tank circuits are needed.

For low-voltage high-power transistor applications mica is not necessary. Also, plastic dielectrics have a somewhat lower loss-factor than mica. But ensure the connecting leads have a sufficient current-carrying capacity and, as with silver-mica types, use several smaller-value plastic capacitors in parallel if necessary.

If you know that several amps or more of RF current will be flowing, DO NOT USE capacitors of any sort with connections which look like fuse wire !

Well, yes there ARE LESS QUESTIONS, but they are much more obscure and require more work to memorize them! (questions most of us forget as soon as we have the ticket BTW!)

>but we require 20wpm code. Is 20wpm code speed more important than,
>say, more technical knowledge about microprocessors?

You DON'T need technical knowledge about microprocesors to be a 1990s radio amateur! All you need is the knowledge you can look up in the OPERATORS MANUAL on how to USE your appliance!

Less than 0.00001% of amateurs would need to know ANYTHING about how the innards of their CPU works, and that would be the guys who program them for their homebrew digi-projecs!

>Why not a
>soldering test? How about a DSP programming test? Among those who
>aren't just "lazy people" the debate, IMHO, is more about which skills
>are most valuable, and which skills are less valuable.

How many hams solder any more? I bet it is less than 25%
DSP operation? Refer to my remarks above about reading the manual.
SO many brands, so many techniques. I HARDLY think an FCC test could cover that skill!

No easy answers on whatis relevant to test. Good discussion though. Keep the code test! It's still relevant. Listen on the air. PLENTY of A1 QSOs still going on!

There are a few books out there with some information on the WW-2 era radios used by the OSS, SOE, and other Resistance Groups. There are three by H. Keith Melton entitled:

CIA Special Weapons and Equipment

OSS Special Weapons and Equipment

Clandestine Warfare

These books have all sorts of gear - not just radios. The information on the radios tends to be photographic and some capabilities information. For the most part, no schematics.

There is another book by Pierre Lorain
(which was adapted in U.S. by David Kahn) called:

Secret Warfare

This one has some more detailed info on the radios and how they were used and includes some schematics.

A later poster notes that many of the radios were quite simple and probably similar to something one might find in an ARRL handbook between the years 1940-1950, or the RSGB equivalent. This appears to be an accurate observation. There is one radio noted called the "Paraset" which is a 6V6 transmitter and a Regen Receiver using two 6SK7s. Of course, (as we Old Timers know) the Regen Receiver may have transmitted as well as the transmitter. In fact, the enemy DF crews could probably track down a receiver almost as easily as the transmitter.

Most recently (mostly last half of 1995, I think) there were "nostalgia"
articles by Dave Ingram K4TWJ in "CQ Magazine" and the September 1995
issue had plans for a very simple tube transmitter and receiver using
battery operated tubes.

For something a little more "vintage" find a September 1960 copy of
Electronics Illustrated. It has a classic transceiver which uses a 6V6
transmitter, 6U8 Regen/Audio Receiver, and a 5Y3 Power Supply. It is
very similar in concept and construction to some of the OSS/SOE rigs
shown in the books I mentioned in my previous post.

Hi,

I really need some advise.

My HTX-404 HT is overwhelmed by the high Gain antenna and GaAs FET
Preamp in my RF Concepts 4-32 Linear AMP when I work 440 Repeator
35 miles from me. Hoots, dialing tones, whistles, noise is incredible
and disruptive.

To fix this, I want to add one one more 440 cavities at HT input with
BNC connector T adapter. First I added the BNC T adapter.
I have one port open, and cable going to GaAs FET Preamp.
I hear usual noises, signal and QRM.

I want to get the HT usuable in RECEIVE MODE first.
Later, I will do the TRANSMIT MODE task.

My question and need to understand:

When HT and GaAs FET Preamp are operating, in Receive Mode,
and I hear usual noises and signals, why do the signals all remain
exactly the same when I short to ground, the unused port on the
BNC T adapter while listening to the Local Repeator?
I expected that shorting the coax cable to ground,
thru the unused BNC T port, would silence all signals.
It does not. Disconnecting the cable from GaAs FET Premap
at the HT input, DOES silence the HT.
But shorting the signal to ground thru BNC Adapter does not.
Touching the cable connector shell to HT shell
causes NOTHING to be heard.

I suspected signals might be on outside of coax could be entering
HT. Do not have correct ferrites, but did install several
large diameter cores over coax cable. Did NOT help.
Neither did SPLIT FERRITE suppressor core from Radio Shack.

If shorting the cable to ground cannot suppress incoming
signals from local repeator, how can a LOW Z (off resonance)
cavity suppress any signal that is off frequency?

Need advise and understanding and methods to diagnose
and possible fixes?

This is not even a CAVITY issue yet.

Thank you,
73, W6MIK

Hi David,

You may be confusing what comprises a DC short and what comprises a short (Low Z) at 70cM.
When you short the unused BNC port- that short be it only a fraction of an inch long has inductance. It does not take much inductance to yield sizable reactance at 70cM. Secondly, the quasi short is not exactly in parallel with the coax but is rather through a short length of concentric transmission line (the length of the BNC leg) and this will further transform the reactance to a higher value.

Your solution would be a series of cavities configured as a bandpass filter (see DCI on the web) or a notch filter set up to notch the offending signals- most likely pagers at 454 or 462- see or filters at http://www.parelectronics.com
Finally, turning on that GaAsFET preamp is the worst thing you can do. They might marginally help a weak SSB or CW signal but will have NO observable effect on the S/N of an FM signal- especially since it is in the shack not up on the tower. So if turning off the preamp makes the intermod go away- leavg it off.

Hi,
I've recently bought 11years of PW from 76 upto 87.
There are quite a few projects in them!
I'd like info on the Portable 2m Tx called "The PW Nimbus".
It was in 80something or other! Email me if you have any details and I'll dig out the one that has it in!!!

Poor timing<grin>, I just saw that article this afternoon, it was in either January or February 1999 QST. Unfortunately, I saw it just as I handed both my January and February QSTs over to a guy in the next town who's gotten interested in ham radio...

I would visit http://www.arrl.org and see if there's any information there about ordering back issues of QST. They can probably also verify which issue this article is in.

>Please offer opinions on this choice of mobile antenna setups. A
>screwdriver antenna with a 96" whip or a broad-range autotuner with a
>96" whip.
>

And the answer is Neither! Screwdrivers & bugcatchers both should have the coil that makes them a center loaded antenna above the roofline of the vehicle in question, and unless you plan on tying down the whip so that it's below 13'6" tall, neither will work as you apparently hope. That being said, it's hard to conceive of an antenna which will perform less well on 75 M, 40 M and 30 M than a base loaded whip which is what a 96" whip with an autotuner really is.

The ideal solution would be to mount the screwdriver so that the coil is at least
one foot above the roofline of the vehicle, then trim the 96" whip down until with
the coil fully extended it's below 13'5" height and you can clear underpasses and many trees. Even if you live in the desert, and there are no trees, there
are overpasses and underpasses and other similar objects. Oh yes, one more point about most screwdriver antennas, if you do tie the whip down, it will still work, but you may lose 10 M and possibly 12 M coverage with such a long whip. However if you are interested in signal strength, the base loaded whip is such a bad idea that it can be eliminated, SGC advertising notwithstanding.

Can't you just answer the guy's question instead of advertising your lack
of knowledge by nitpicking it to pieces?
He obviously meant monochrome as in BLACK & WHITE. Instead you give out with
all this BS about stations broadcasting in only one color ('scuse me, colour)
and ice cream and chromatic density and blah blah blah. Sheesh.
All you're doing is evading the question and making yourself look like a
jackass in the process.

5520. HBR reflector now available

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-30 00:00:00 UTC
From: robertc908@aol.com
Message-ID: <19990530113921.10853.00005365@ngol04.aol.com>
Source record: 69811

For those of you that are interested in HBR receiver the reflector service at qth.net is now available. To subscribe just send a note to majordomo@qth.net and in the body of the text just say subscribe HBR. You will receive a confirmation message with addtional instructions. Just follow the instructions and your all signed up and will receive messages from the reflector just like Hallicrafters, Hammarlund, etc.
Below is a brief description of this group.

Do you remember the HBR receivers that were designed by the late Ted Crosby, W6TC? There were several versions of these very popular homebrew receivers. The first was the HBR-14 published in the July 1957 QST, followed by the HBR-16 in the October 1959 QST, the HBR-8/11 in March/April 1963, the HBR-12 in April 1964, and the HBR-13 in the October 1965 QST. There were also many improvements and add-ons by others, Alexander Stewart, WA4ZNI and William McKay, W7QBR to name just a few.

Many HBRs were built, and there is presently a small group HBR enthusiasts who are interested in your stories about the HBR you anticipated building, built,
used, or currently use. We would like to know your perception of how well it performed, problems you had with construction, calibration, etc. We're also interested in hearing from those of you curently trying to locate an HBR or if you anticipate building one.

We would like to hear about any correspondence that you may have had with Mr. Crosby, Mr. Stewart or the authors of HBR related articles published in QST and other amateur publications. Also, don't forget Mr. Ed Kent, K8EML, he was the compiler of the original HBR Notes. Did you have any correspondence with him? Tell us about it!

If you are currently interested in building one of these fine receivers we invite you to network with us. There are no fees, we're just a group of HBR enthusiast that help each other locate and obtain the necessary parts, share construction hints, etc.

In summary, if you're an admirer of the HBR tube receivers, then we would like to hear from you.

73's
Bob, W4RLC (formerly WA7OGU)

50:1 transformer from 50 ohm source with 50ohm load across input side
will do. With 1V RMS input you have 20mVRMS 20milliOhm source.
For Q=100 the voltage on top of coil or capacitor is 2V
It is a good idea to use a voltage divider feeding the detector, a 1:3
capacitive divider has an effect of 1:9 as impedance transformer to
feed a diode detector, or use 1:30 (capacitive ratio) to feed somewhat
lower impedance RF amplifier, suggested values 1pF and 33pF (1/34
ratio)

Having some available Q-meters, I modified Heathkit QM-1 as an
experiment using some of the technique above, but uses 6BA6/EF93 grid
detector (6AU6 did not work, a better valve is EF6 as used with
Radiometer Q-Meter, but I couldn't find any replacement for the 60
year old valve)

For all those who are intensely interested in this subject area, you might wish to contact Allen, W4PHL.

He is an electrical engineer. In his youth he not only designed much of the OSS gear used in the Southeast Asian Theater but also managed the operative s' clandestine network.

Now in his 80s, he is very active on the air and still works fulltime as a professional in the Emergency Management field.

He's as sharp as ever and can certainly add a chapter or two to the history of this fascinating field... one to which hams contributed immeasureably. Over breakfast this past Saturday, I encouraged him to document his incredible OSS experiences and I believe he would be open to a sincere writer/researcher.

Hi,
I'm after a good supply of Analogue Cell phones/Mobile phones.
I'm intending making a 50mhz (6m) HT out of them and I need a few of them.
There is a company in the UK called Bull Electrical that sell them for £10
($7). That's a bit much for what I want.
Anyone with any Cell Phones/Mobile phones please email me!!!

I'll glady pay any costs to homebrew a TX. I'm not into buying "black
boxes"!!!

David

Hi Peter.

It sounds to me as if an "INTERDIGITAL FILTER" would suit your purposes.

There was a design article in

10' PROGRAM NAME 'DIGITFIL.BAS'
20' FROM HAM RADIO JANUARY 1985
30' JERRY HINSHAW, N6JH 4558 MARGERY DRIVE, F'ONT CA 94538

It included a CAD program in basic to calculate dimensions. I wrote it into QuickBasic back when it was published... If there's an interest, I will post the program file.

However, I recommend digging up the article as well. My memory is a little hazy as to how my program outputs the data, and how it should be used to manufacture the actual filter.

Some years ago, I needed a filter at 2.4 GHz, and used this program to calculate it. The physical filter agreed with the CAD program, which is always nice to see.

I once made the mistake of posting my actual EMAIL address when I I posted something in this newsgroup... I am STILL getting junk mail !!!

So, my actual EMAIL is jpennell
Let's see if the spambots @
are smart enough to ix.
sort this one out. netcom.

For even lower prices for 73 and other magazines, send an e-mail to bcmag1@ixpres.com and request their catalog.

You will find 73 for $8.75 a year, CQ and CQ-VHF also for $8.75 per year.

I've delt with them for many years and they are the cheapest source I'm aware. When you don't offer million dollar sweepstakes, you can offer magazines for much lower prices.

No association with this source except for being a satisfied customer.

Hello--

IIRC, the company name was "Vernitron" and they also manufactured
potentiometers. Vernitron *may* have been acquired by IRC sometime in
the 1970s.

I have the following items for sale......

Henry S-80 2M mobile amp, 80W out / 5W in - $50

Homebrew 80-6M base amp, 1.5KW out / 100W in, VSWR; Temp; Overcurrent protection, Thermaly switched cooling, Digital power display, Seperate amp and power supply decks. Requires 220VAC. Uses 8 MRF151G dual power MOSFET's. More info at -http://www.eskimo.com/~wizard- only $1800

10KHz-230MHz lab amplifier. Wideband MOSFET amplifier. It delivers a minimum output of 35 watts throughout its range. 1 milliwatt input required for full output. This class AB (all mode) linear amp includes F/R power metering, built in power supply, thermal protection, 100% duty cycle operation, ALC and RFG control, VSWR and overdrive protection, Temp protection, and remote control capability. Has computer generated data. Setup for 120VAC. $1200

RF power labs 0.5-250MHz amplifier. 5W 37dB gain, built in power supply, watt meter, temp protection. Has computer generated data. Similar to Kalmus engineering model 505C. Setup for 120VAC. $350

More info for these amps at -http://www.eskimo.com/~wizard/labamps-

Power transformers, 100A, provides 16V and 32V taps with 120/240V input. Still in box. Full data provided. May be paralleled for higher current. Unit weighs 45 lbs. $85 plus shipping from 98012 zip.

Bear in mind, however that modern caps tend to be low voltage rating
(usually 50 V) so may not be suitable for valve gear where voltages are
likely to be higher

Hello, I got the following emailed to me but I am not very good at schematics, much less ASCI art. Could someone please decode the below simple plans for a approxamately 10 part QRP rig for me? Also, can this thing receive, or just transmit?
Thanks, Eric
****
I built this for 80M only because I've got so many 3579 kHz crystals from old TV sets, but this can be used on any HF band - just choose L and C to resonant at the crystal frequency. For peace of mind you might want to add a bandpass filter to the
output. ----------*---------*--------*----||---ANT | | | | 10pf | | | | - |) --- XTAL |) --- C - |) L | | | / c) | *----------|/ | | | b |\ | | | 2N2188 \ e *--------- / or any PNP | | \ 100K that'll work | | / GND | \ | | | *----------* | | | | | --- | --- .01uf | | ---------*KEY*----*1 to 4 volts +*--------* | | GND Again, choose L&C to resonant at the desired frequency; one of the two should be adjustable.

No<g>.

Seriously, I'm afraid it was badly mangled in transit - it just doesn't make sense. That's unfortunately not uncommon with ASCII drawings, especially if the drawer isn't careful to keep the line length short.

I don't see enough parts in there to make a receiver, I'm pretty sure it just transmits.

5550. 1.5 GHz Bandpass Filter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-31 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <7iuil6$812$1@news.netcologne.de>
Source record: 69828

Hi,

I'm looking for a narrow (20 - 30 MHz) bandpass filter with a center frequency arround 1.5 GHz. There seem to be no helix filters with this bandwidth available and the coupled resonator ceramic filters (e.g. the Siemens types) are hard to get here.

Might a cavity filter be a solution? If so, how are the dimensions of the cavity calculated?

Any other ideas? Literature?

Peter

5551. SWR/Power meter help

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-05-31 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <19990531140247.15034.00002180@ng-fn1.aol.com>
Source record: 69829

I have a Bird 43 watt meter with a couple of VHF elements. I would like to use it on HF but cannot afford the slugs. What I was thinking of doing is building a coupler that can be used with the external input on the meter. Initial idea is a small box with RF connectors on opposite side. The 2 connectors would be connected to gether by a short straight wire passing through a toroidal pickup coil. The resulting voltage would be rectified and scaled before feeding it to the meter. I would like to get in touch with anyone who has succesfully done this.

5552. Re: Opinions on choice of two moblie antenna options??

Newsgroup: rec.radio.amateur.homebrew

Check out an antenna book in the section on short antennas. This
should explain why you don't want to use a base loaded antenna. It's
all about current distribution. RF current produces RF field.

>all this BS about stations broadcasting in only one color ('scuse me, colour)
>and ice cream and chromatic density and blah blah blah. Sheesh.
>All you're doing is evading the question and making yourself look like a
>jackass in the process.

He dosn't need to make himself look that way!

It's going to show itself nomatter what he says!!!!

If it looks like a duck, walks like a duck, quacks like a duck, it must be a "DUCK"!!
